1. Software Overview

The Go Configure Software Hub is a software product used to create a design for a specific device configuration. The software provides direct access to all GreenPAK, ADCPAK, and ForgeFPGA device features and complete control over each device's routing and configuration options.

The software contains the tools that makes it possible to:

- Create an FPGA Project in Verilog
- Program a chip with the created design
- Read a programmed part and import its data into the software
- Run simulations with external components

Getting Started:

1. To create and debug a new design with ForgeFPGA follow the next steps: Download and install Go Configure Software Hub from <https://www.renesas.com/us/en/software-tool/go-configure-software-hub>

Start your project from the Hub window with the following sections:

- *Home* — useful info and tips for new users
- *Recent files* — the list of the recently opened project files
- *Develop* — the chip Part Number selection. See the Details section to learn more about the selected chip.

At the bottom-right of the window, you can find the New, Open, and Close buttons, which allow you to start a new project for a selected Part Number, to open an existing project, or to close the Go Configure Software Hub. The Datasheets, Product Page, Application Notes, Resources, Get Samples, Contact Us Link, and User Guides buttons redirect you to the Renesas website, where you can download the corresponding files.

- *Demo* — the list of Demo projects. You can use the specific Demo Board for project debugging
 - *Application Notes* — design examples for different purposes. An application note includes a design description and a preconfigured circuit project, where you can make customized changes
2. Select the SLG479xx Part Number & open it
 3. Specify the Project Settings like V_{DDC} , V_{DDIO} and Temperature (°C)
 4. Write the Verilog Code in the Editor Window
 5. Configure the blocks properties such as GPIO, PLL, etc. as per the design requirements
 6. Test the design with the Debug Tool, using the Simulation feature or any of the supported hardware development platforms.

Details

[[Contact us for Datasheet](#) | [Product page](#) | [Application notes](#) | [Resources](#) | [Get samples](#) | [Contact us](#)]

Package:
QFN-24

Supported Development Platforms:

- ForgeFPGA Advanced Development Board (SLG7DVKFORGE) + ForgeFPGA Socket Adapter #1 (SLG4SA24-30x30)
- ForgeFPGA Evaluation Board

Description:
The SLG47910V provides a small, low power component for common FPGA applications. The user creates their circuit design by programming the One-Time Programmable (OTP) Non-Volatile Memory (NVM) to configure the interconnect logic, the IO pins, and the Macrocells of the SLG47910V. This highly versatile device allows a wide variety of FPGA applications to be designed within a very small, low power integrated circuit. The macrocells in the device include the following:

- Dense Logic Array:
 - Equivalent to 900 4-bit LUTs;
 - 1.8 k DFFs;
 - 5 kb distributed memory;
 - 32 kb BRAM;
 - Configurable through NVM and/or SPI interface;

New Open Close

Figure 1. Go Configure Software Hub User Interface

2. ForgeFPGA Workshop

The ForgeFPGA Workshop is the main window of the software. This window displays the FPGA Core and each of the special components that connect to it such as the Phase Locked Loop (PLL), Oscillator (OSC), BRAM, and the GPIOs. The FPGA Editor can be launched from the middle button on the toolbar at the top in addition to navigating to Main Menu Tools → *FPGA Editor* or by double-clicking the on the FPGA Core (grey square).

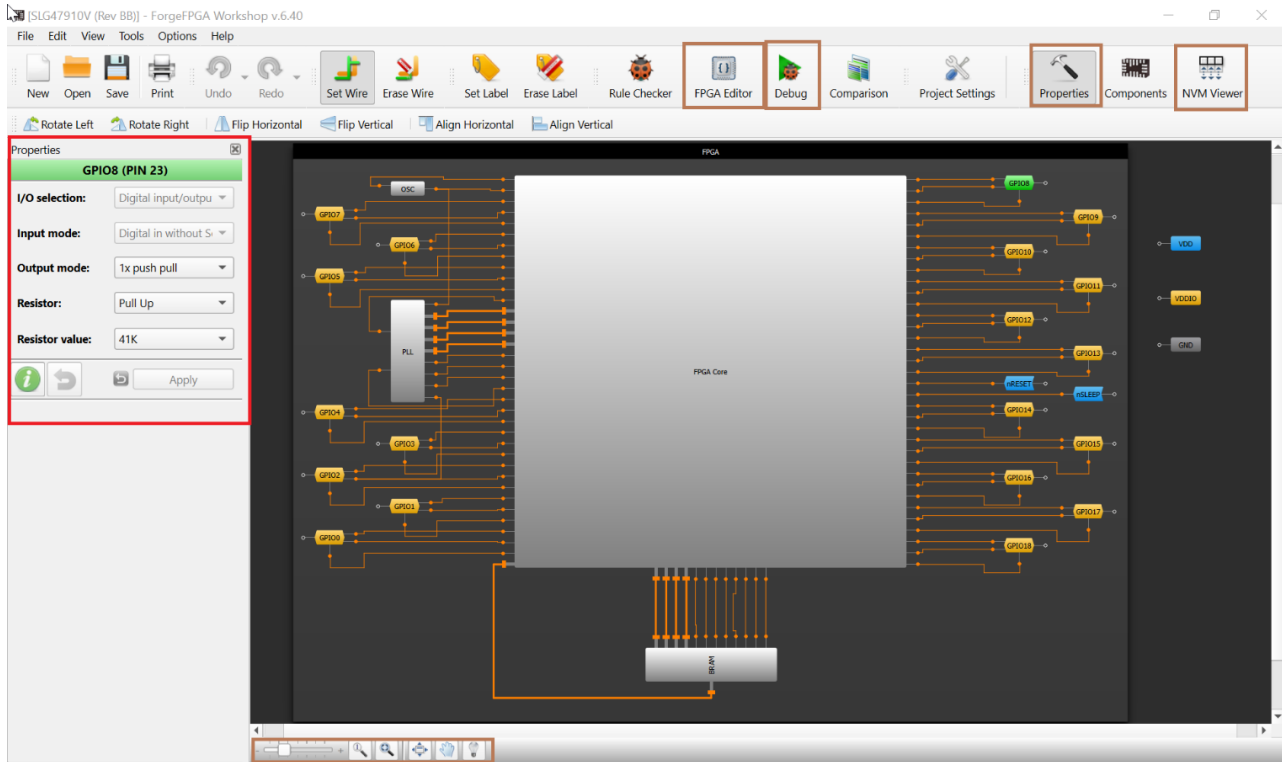

Figure 2. ForgeFPGA Workshop

This window is designed to cater to the device selected. The above figure is for SLG47910. A different setup of blocks will be seen for SLG47921, etc. based on its pin assignment.

2.1 FPGA Editor

The FPGA Editor is an Integrated Design Environment (IDE) tool designed to create and configure the FPGA logic. The editor allows you to create designs for Field-Programmable Gate Arrays (FPGAs) using a Hardware Description Language (HDL)* - Verilog. Before the design is programmed onto the FPGA, the editor provides an option to simulate it first and ensure it operates correctly.

In addition, the FPGA Editor makes it possible to work with external designs by importing files with the created logic mapped to the components. Find the descriptions for these and other features in the following sections.

2.1.1 Flowchart

A flowchart is available to provide a step-by-step guide on creating a design from start to finish. The flowchart (Figure 3) describes all the important aspects of using the ForgeFPGA software.

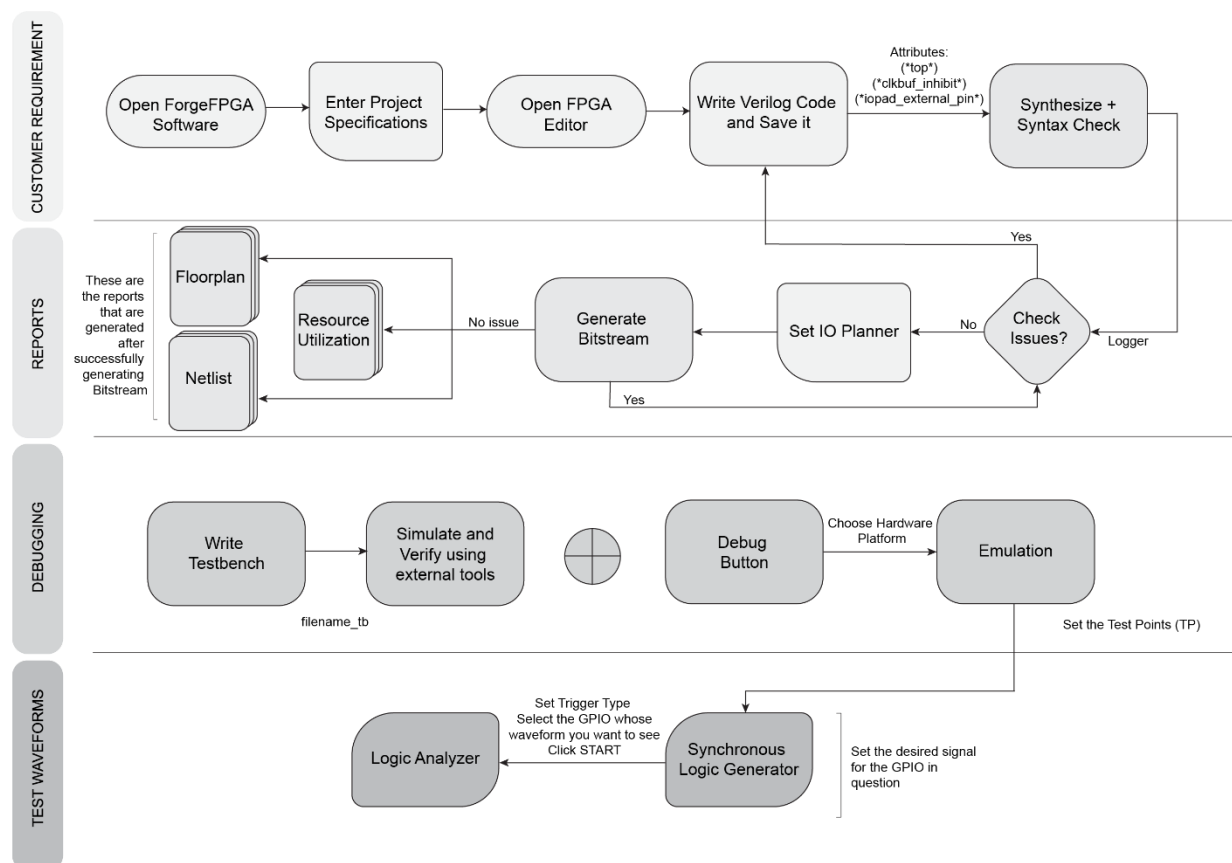

Figure 3. Toolchain Flowchart

The development software consists of the main menu, toolbar, main work area, logger panel and control panel (see [Figure 4](#)).

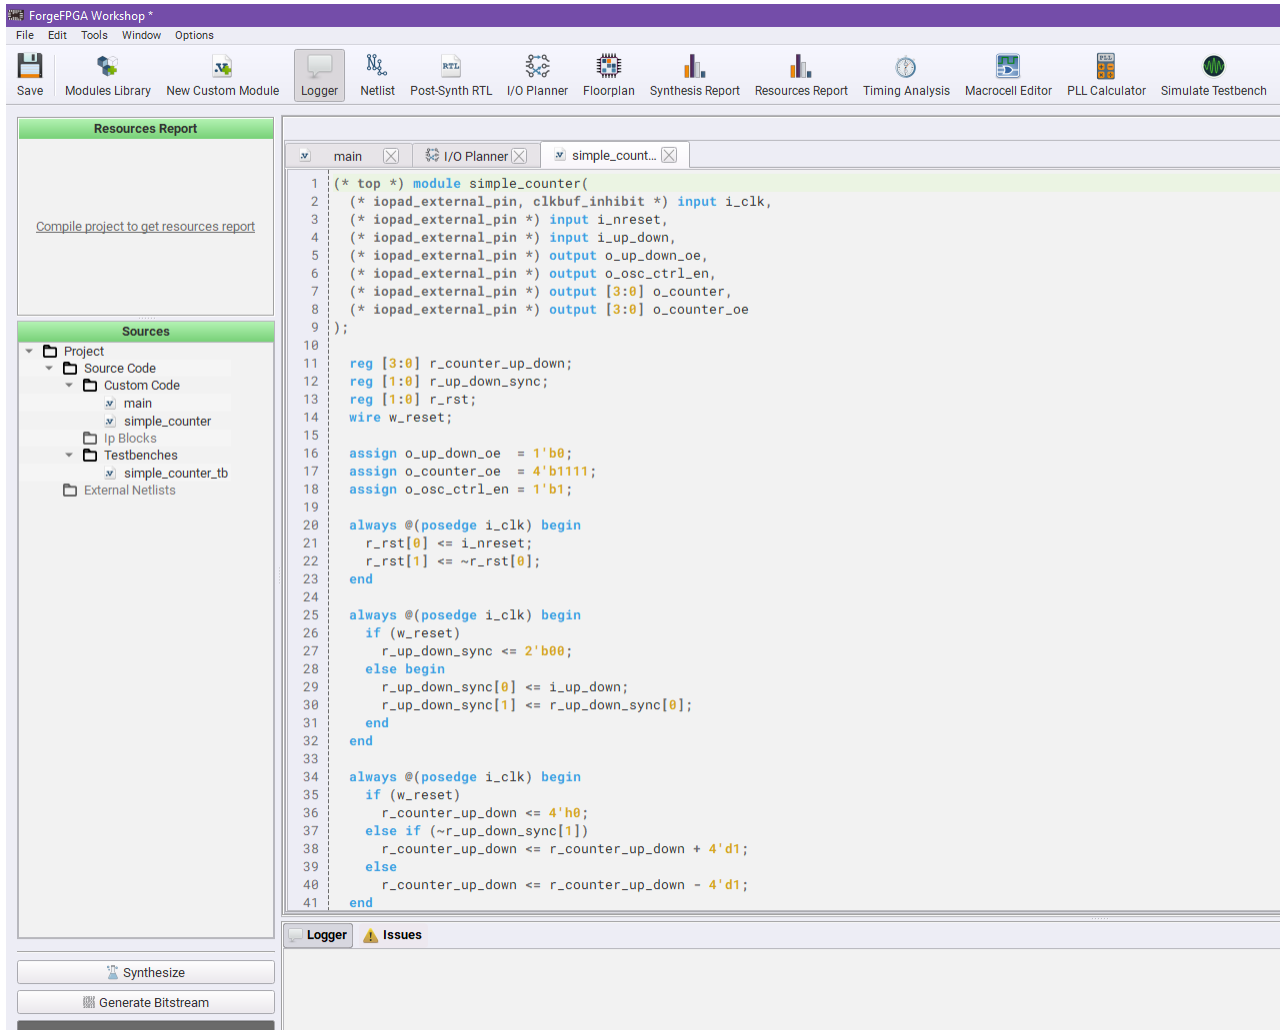

Figure 4. ForgeFPGA Workshop User Interface

2.1.2 Main Menu

Main Menu contains controls are described below:

File

- └ Save – save current project
- └ Save All – save the whole project
- └ Modules Library – open IP Blocks Wizard
- └ New Custom Module – add new module
- └ New Custom Testbench – add new testbench
- └ New Timing Constraints – add .sdc file
- └ Import – used to import an RTL code, testbench and Netlist from another software/synthesis tool
 - └ Custom Module
 - └ Custom Testbench
 - └ Netlist
 - └ Timing Constraints
- └ Export
 - └ Custom Module
 - └ Library Module

- └ Testbench
- └ Timing Constraints
- └ Load Design Template
 - └ Simple Counter
- └ Close

Edit (menu works with editable tabs)

- └ Undo
- └ Redo
- └ Cut
- └ Copy
- └ Paste
- └ Delete
- └ Select All
- └ Find

Tools

- └ Run Synthesis – synthesize Verilog code into low-level constructs.
- └ Generate Bitstream – compilation and mapping low-level constructs to specific device blocks.
- └ Floorplan
 - └ Load customer PnR
- └ Simulation
 - └ Simulate Testbench
- └ I/O Planner
 - └ Clear data
 - └ Import I/O Spec
 - └ Export I/O Spec
 - └ Import I/O Spec from CSV
 - └ Export I/O Spec to CSV
- └ PLL Configurator

Window

- └ Netlist – read-only tab with a description of the connectivity of an electronic circuit
- └ Post-Synth RTL (register transfer layer)
- └ I/O Planner
- └ Floorplan
- └ Synthesis Report
- └ Resources Report
- └ Timing Analysis
- └ Macrocell Editor
- └ Messages

Options

- └ Settings

2.1.3 Toolbar

The top toolbar provides quick access to a set of tools and actions. See the description of all the available tools in the next few sections.

Figure 5. ForgeFPGA Workshop Toolbar

2.1.4 Work Area

The work area is the central white portion of the software where the user can type their desired HDL Code. The work area has a split screen option (see [Figure 6](#)) which allows the user to split the screen and work with more than one tool simultaneously. The user can choose which views appear in either of side of the split screen by clicking the tool. The user can also close the split screen when not needed.

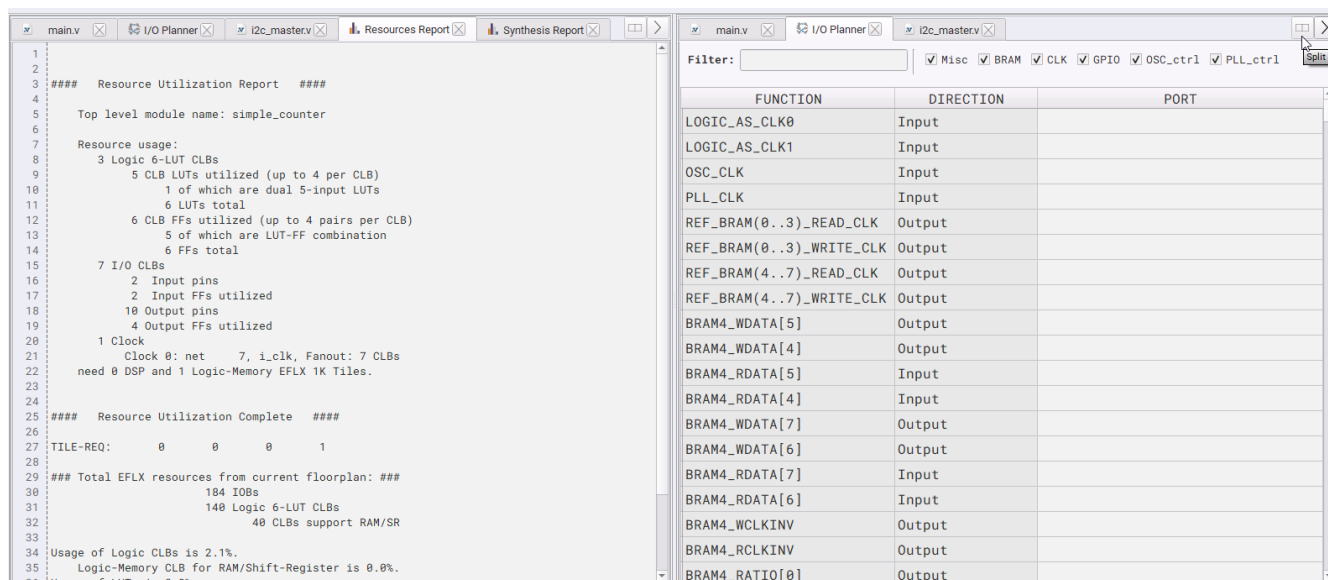

Figure 6. Work Area

2.1.5 Messages Panel

Here you can see the generated messages that appear after you use Synthesize, Generate Bitstream and Simulation procedure (see [Figure 7](#)).

- **General Log** – shows information messages along with warnings and errors that were recorded while processing the design.
- **Synthesis Log and Bitstream Log** – provides the output generated while the procedure is performed
- **Issues** – displays the warning and error messages that are automatically generated by the software when required. Once you receive a syntax error, you can right-click on it and select 'Show in Editor' to highlight the line in your HDL code where the mistake was detected.

Figure 7. Messages Panel

2.1.6 Control Panel

From the left control panel, you can access the following information (see [Figure 8](#)):

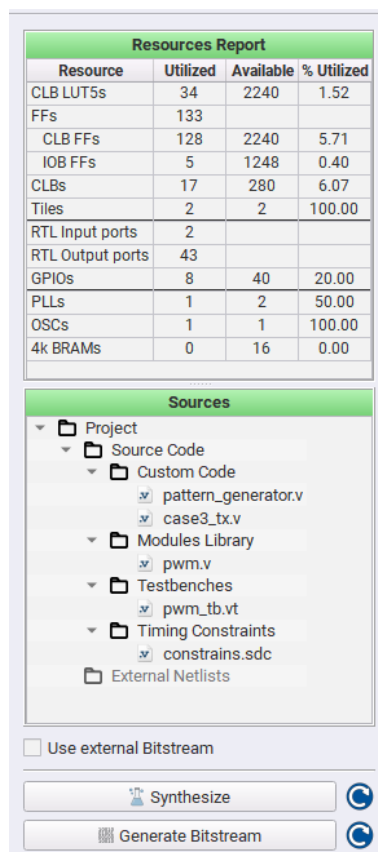

Figure 8. Control Panel

- **Resources Report** – Extracted from the resource usage report. It shows the part of available resources utilized by the design sources. Visually, it is divided into three sections. The upper part reflects the internal logic used in the project against the total available. The middle section shows connection-related information (RTL ports, GPIOs). The last part summarizes the utilization of internal components, such as OSCs, PLLs, and BRAMs.
- **Sources** – a list of all Verilog design files and external netlists (if used) that are in the current project file. Here you can find the following subcategories:
 - Custom Code
 - Modules Library
 - Testbenches
 - Timing Constraints
 - External Netlists

The Sources list can be customized via the context menu with the options to Add, Delete, or Rename the sources.

- **Synthesize and Generate Bitstream** – main controls to run toolchain on your design to produce chip configuration. Hover over the icon next to the procedure button to see the status details, such as whether the procedure was successful, failed or if the Verilog file has been changed.

2.1.7 Settings

The user can access the settings from the *Main Menu* → *Options* → *Settings*. The user can change various settings for the project and change some user settings in this GUI (see [Figure 9](#)).

Project Settings

- Synthesize** – a process where the HDL code is compiled and converts a high-level description down to lower-level description, for example logic gates.

- i. Flatten* – Flatten design before synthesis. This option instructs the tool to fully flatten the hierarchy leaving only the top level. Cells and/or modules with the 'keep_hierarchy' attributes set will not be flattened by this command.
 - ii. No DSP* – Do not use DSPs to implement multipliers and associated logic during the synthesis procedure.
 - iii. Keep* – Create extra KEEP nets by allowing a cell to drive multiple nets while generating the EDIF netlist.
 - iv. Use ABC9* – Use ABC9 for technology mapping. The ABC9 pass uses much newer optimizers and mapping, for a modest improvement in optimization, and a possible big improvement in LUT mapping.
 - v. Additional arguments* – Add additional arguments to the synthesis procedure.
- b. Generate Bitstream* – this is the final step before programming the FPGA. Under this process, Yosys performs processes such as Translation & Mapping, Place & Routing and Resource Utilization calculations. A binary file is generated that contains configuration information.
 - i. High Density IO Packing* – Allows packing of input and output IOs into a single IO cell. Improves I/O utilization but can worsen congestion and timing.
 - ii. High Density Packing Logic* -Allows you to achieve higher resource utilization per CLB but can worsen congestion and timing.
 - iii. Clock-Concurrent Optimization (CCOpt)*- Enables Clock-Concurrent Optimization to further optimize timing (must disable Ideal Clock) at the expense of potentially higher clocking power.
 - iv. Place-and-Trial-Route* – Iteratively run place-and-trail-route refinement to attempt timing improvements. Iteration count is defined by the "Place-and-trail-route iteration count" option.
 - v. Place-and-Trial-route Iteration count* – Used with "Place-and-Trial-Route", sets the number of iterations for place-and-trial-route to attempt timing improvements.
 - vi. Maximum Routing Iterations*- Maximum number of routing iterations before exiting with the last clean solution with the best achievable timing.
 - vii. Maximum number of CPUs for routing* – Defines the maximum number of CPUs used for routing. Settings this option to 1 ensures identical bitstreams when using the same input data
 - viii. Timing Analysis Corner* – select the corner lot that will be used during Static Timing Analysis
 - ix. Additional arguments*- Add additional arguments to the Generate Bitstream procedure.
- c. Simulation* – User can choose to save their dumpfile produced during simulation in two formats - .vcd and .fst format. The difference between both formats is how much memory the file can handle. Users can opt for .fst format when simulating a memory heavy file as it produces a compact binary format file that offers much better performance for very large dumpfiles. It's fast to write and fast to read. VCD is a test format that is easy to read, and which is supported by a lot of different software packages.

User Settings

- a. Messages* – User can choose to opt for erasing the Synthesis and Bitstream log each time they run a new procedure by checking the box.
- b. Tools:*
 - i. Icarus Verilog* -The path to the Icarus Verilog tool. You need to set the path to the simulation engine binary so it can be found during the simulation procedure if the system environment

doesn't have the proper path set. An "Autodetect" option is available, and it will try to automatically find the path to the tool.

- ii. *GTKWave* - The path to the GTKWave tool. You need to set the path to the simulation results viewer binary so it can be found after the simulation procedure if the system environment doesn't have the proper path set. An "Autodetect" option is available, and it will try to automatically find the path to the tool.
- c. *Text Editor* – Number of spaces in tab characters that are shown for all text editors.
- d. *I/O Planner* – serves to manage the display of information in the [I/O Planner](#) table
- e. *Processing* – Checking the box under this setting allows you to save all files before proceeding with the design
- f. *Files* – Enables to software to add _tb suffix to the names of newly created testbench if unspecified
- g. *PLL Configurator* – provides the possibility to manage the behavior of the confirmation window before applying changes in the PLL Configurator

Note: Changes made in the Project Settings category only applies to the project currently being working on. Adjustments made in the User Settings section have a global impact, ensuring consistency across all FPGA-related projects on a particular device. If you switch to another computer, these settings will either be reset to default values or adapted to the configurations of that specific computer.

Follow the instructions provided in the description of the options to avoid errors and improve your design.

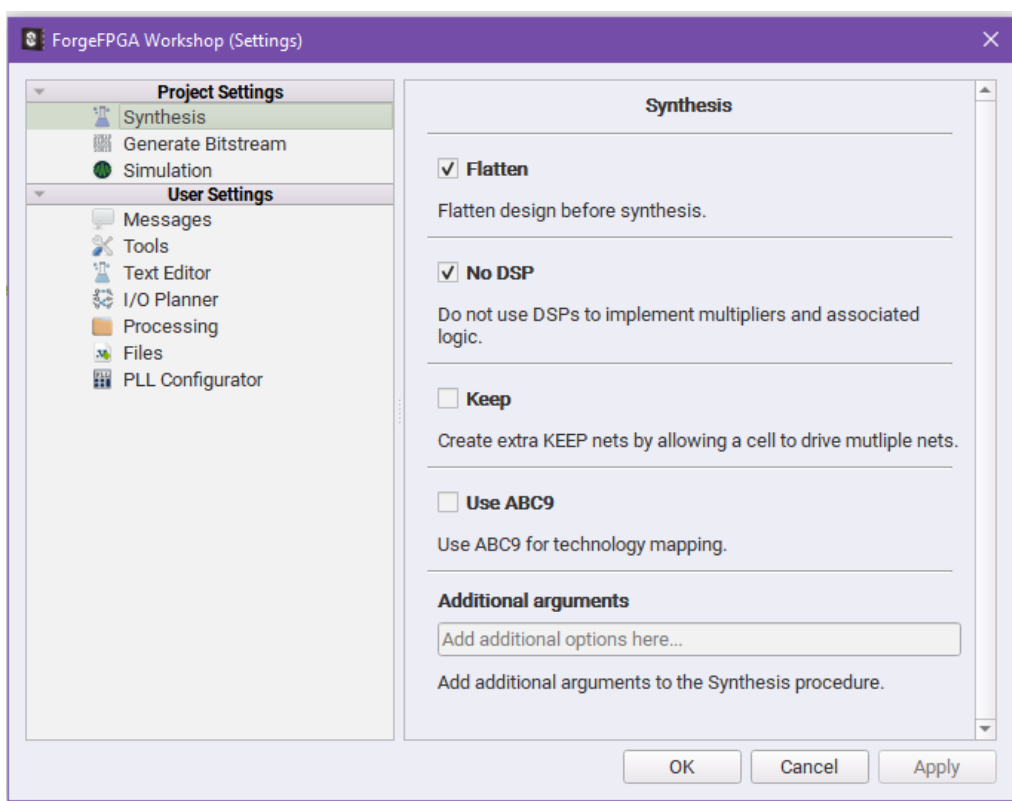

Figure 9. ForgeFPGA Workshop Settings

2.1.8 Design Template

The Design Template offers pre-built designs that can be seamlessly integrated into your project. It can be found under *FPGA Editor* → *File* → *Load Design Template* (see [Figure 10](#)).

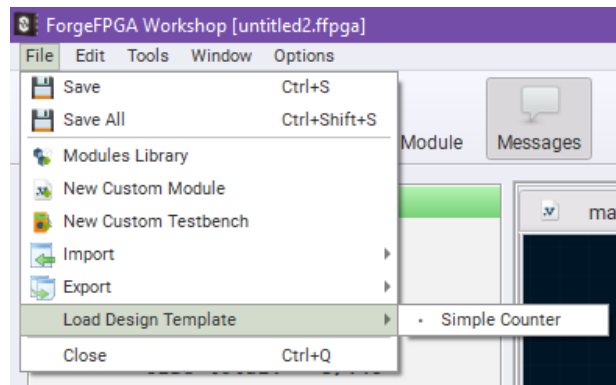

Figure 10. FPGA Design Template

Upon selecting a design template, the Design Template Wizard will appear (see [Figure 11](#)). It will guide you through component selection, IO Spec diff review, and module name suggestions.

Component Selection makes it possible to choose the components to proceed with:

- *Verilog Module*
- *Verilog Testbench*
- *IO Spec*

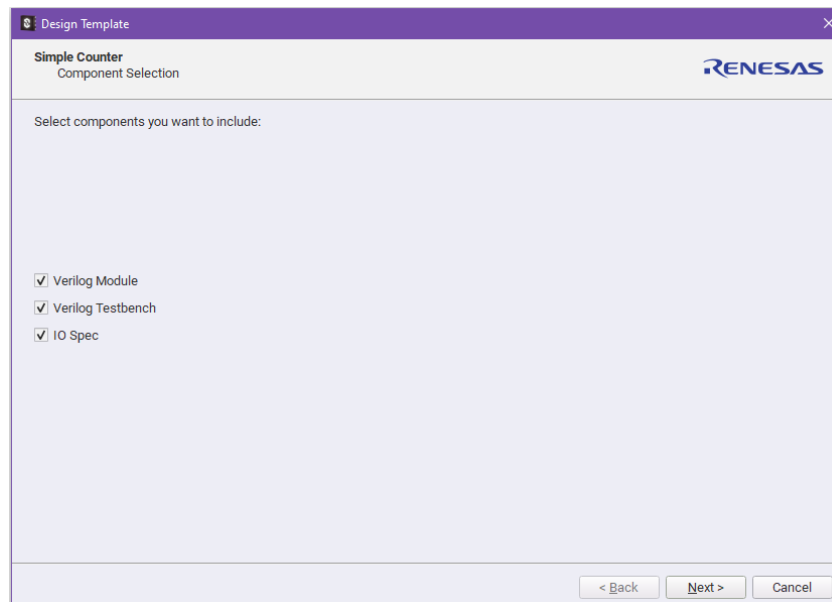

Figure 11. Design Template Component Selection

Select all components or individually select them as needed depending on the desired outcome for your project. The choices made at this stage determine the next steps in the process.

- *IO Spec* -generates an *IO Spec Diff*, presenting a comparison between the existing design port records and the ones associated with the selected template. This serves as a cautionary step as your current port configurations could potentially be overwritten by those of the chosen template. The software highlights conflicting entries in yellow. You can choose to focus solely on conflicts by selecting the *Show Conflicts Only* option. However, if you prefer not to review the IO Specs, the software streamlines the process by skipping the IO Spec Diff (see [Figure 12](#)). In this scenario, the tool will prompt you straight to the Module name.

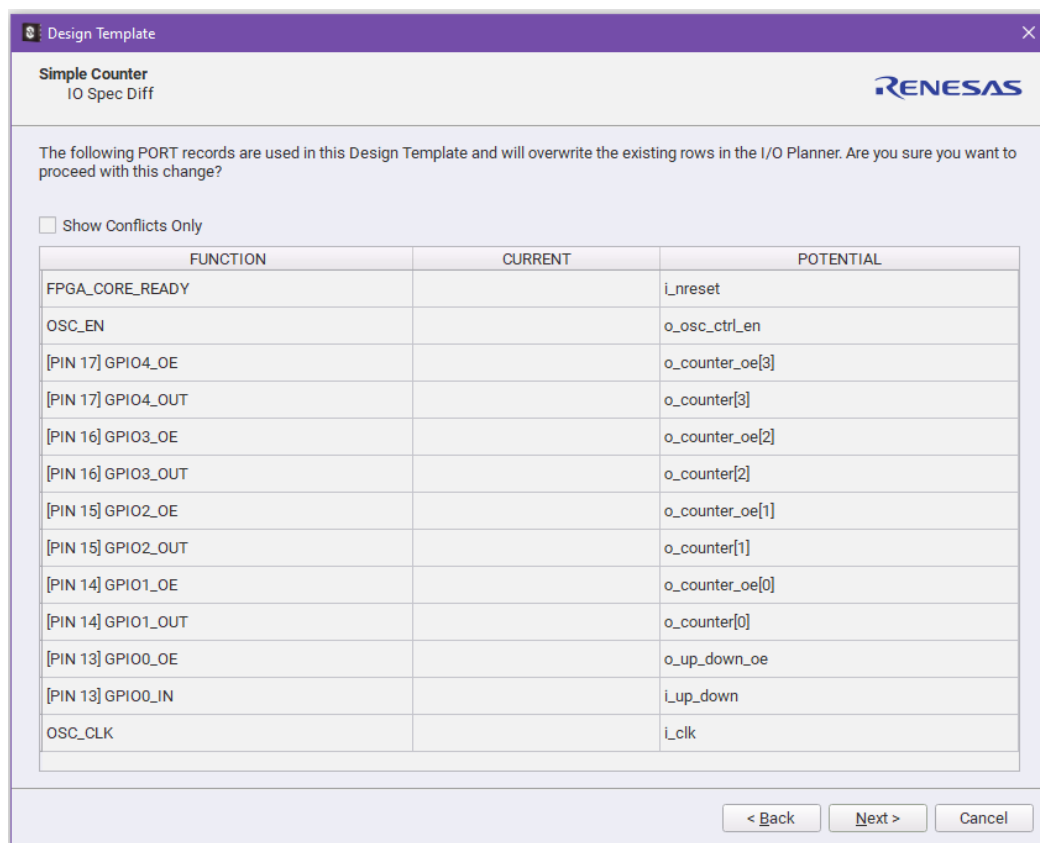

Figure 12. Design Template IO Spec Diff

- *Module Name* - assigns names to your Verilog Module and/or Testbench. If you choose to skip Verilog Module and Verilog Testbench in the Component Selection window, the default names are assigned.

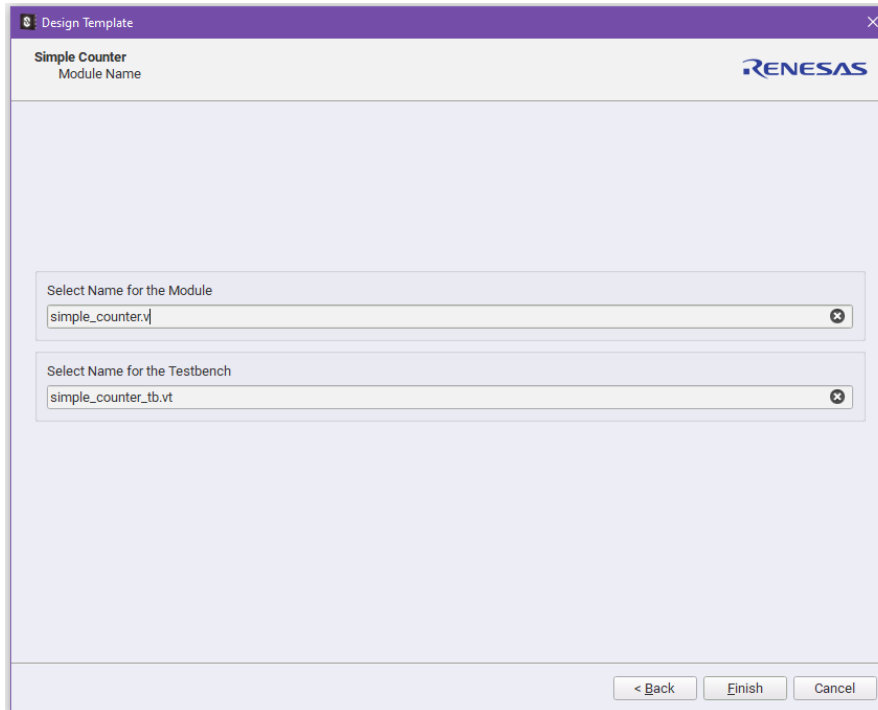

Figure 13. Design Template Module Name

Once the template setup is complete, new elements will be made available in the workspace.

The Design Template Verilog code and Testbench names will appear in the Sources list, with corresponding tabs displaying the actual code and Testbench details.

Additionally, the I/O Planner tab will reflect these changes as well, showcasing the inclusion of port records from the selected design.

Once the integration of the design template is done, you can assess its functionality by running a simulation.

2.2 Writing Verilog Code

The toolchain of the ForgeFPGA Workshop supports Verilog 2005 (IEEE Standard 1364-2005) and System Verilog Syntaxes.

There are a few special code attributes that are important to keep in mind while working with the synthesis tools:

- **(* top *)** – the top module of your design should be marked with this attribute so the toolchain can successfully recognize which of the modules in the design is the top one. [Line 1 – [Figure 14](#)]
- **(* clkbuf_inhibit *)** – clock signals in the input list of the main module should be marked with this attribute to prevent clock buffer insertion by the synthesis tool, which may lead to the distortion of the clock signal name in the resulting netlist. This attribute belongs only to Synthesis, the compile process requires the customer to assign IOBs manually on the I/O Planner that are predefined clock trees. [Line 2 – [Figure 14](#)]
- **(*iopad_external_pin*)** – all external pins that are used in any module need to be marked with this attribute. [Line 2-7 – [Figure 14](#)]

Figure 14. Working with Verilog example

2.2.1 Importing/Export RTL Files

The ForgeFPGA Editor allows you to import external RTL files and netlist that has been created by other software. You can import a Custom Module file, Custom Testbench file or a Netlist. You can import an RTL File by navigating to *Main Menu* → *Import* → *Custom Module* (see Figure 15).

The software supports the following formats for importing:

- Custom Module (supported file formats *.v, *.vh, *.verilog, *.vlg, *.vt, *.sv)
- Custom Testbench (supported file formats *.v, *.vh, *.verilog, *.vlg, *.vt, *.sv)
- Netlist (supported file formats *.edif, *.edn)
- Timing Constraints (supported file format *.sdc)

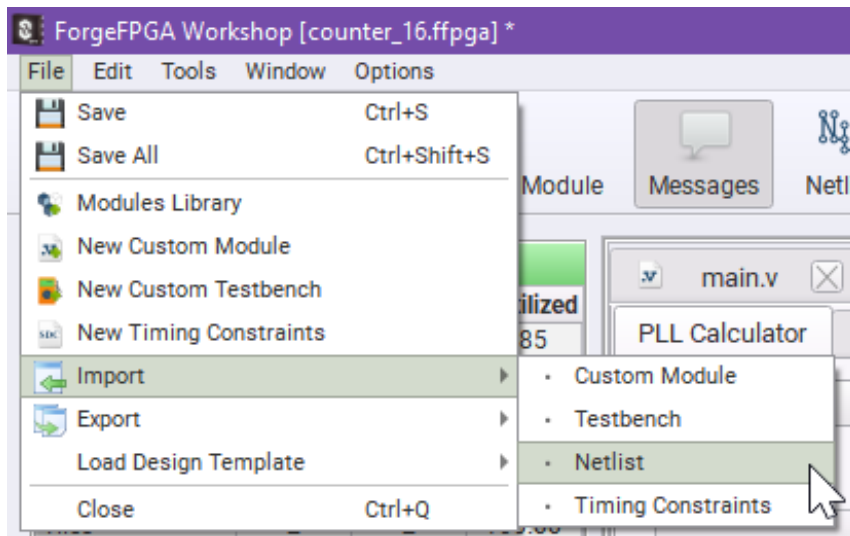

Figure 15. Importing RTL Files

Similarly, you can export files too (see Figure 16). You can export a custom module, library module, testbench or a timing constraint file that you have designed using ForgeFPGA Workshop and save in your system. You can export via *Main Menu* → *Export* → *Custom Module*

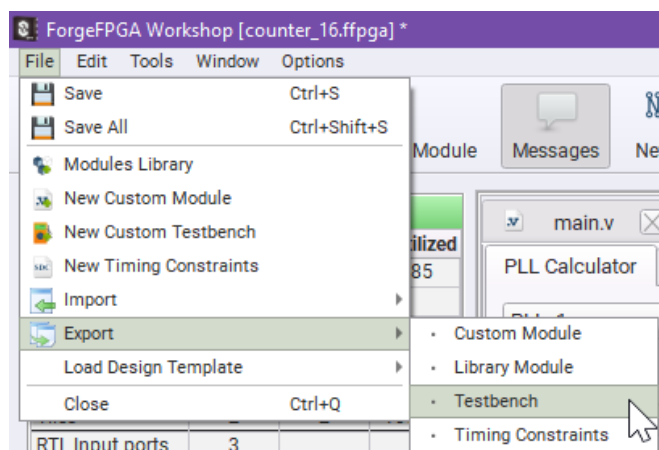

Figure 16. Exporting RTL Files

2.3 Modules Library

The *Modules Library* is a comprehensive repository of pre-designed and pre-verified easy-to-integrate modules. This tool provides HDL code for various hardware modules, accompanied by the testbenches to check their functionality using [Simulation](#).

To open the *Modules Library*, click the corresponding button on the toolbar or navigate the main menu, *File* → *Modules Library*. Choose the module, set the required configurations, and add the name to complete the module creation (see [Figure 17](#)).

Inside the *Modules Library* GUI, you can find the schematic and port information along with the description of the selected block. The GUI gives a detailed explanation of all the input and output pins of the block and allows you to change the parameters as desired. This gives you the flexibility to create the HDL code of the module needed and its associated testbench with just a few clicks.

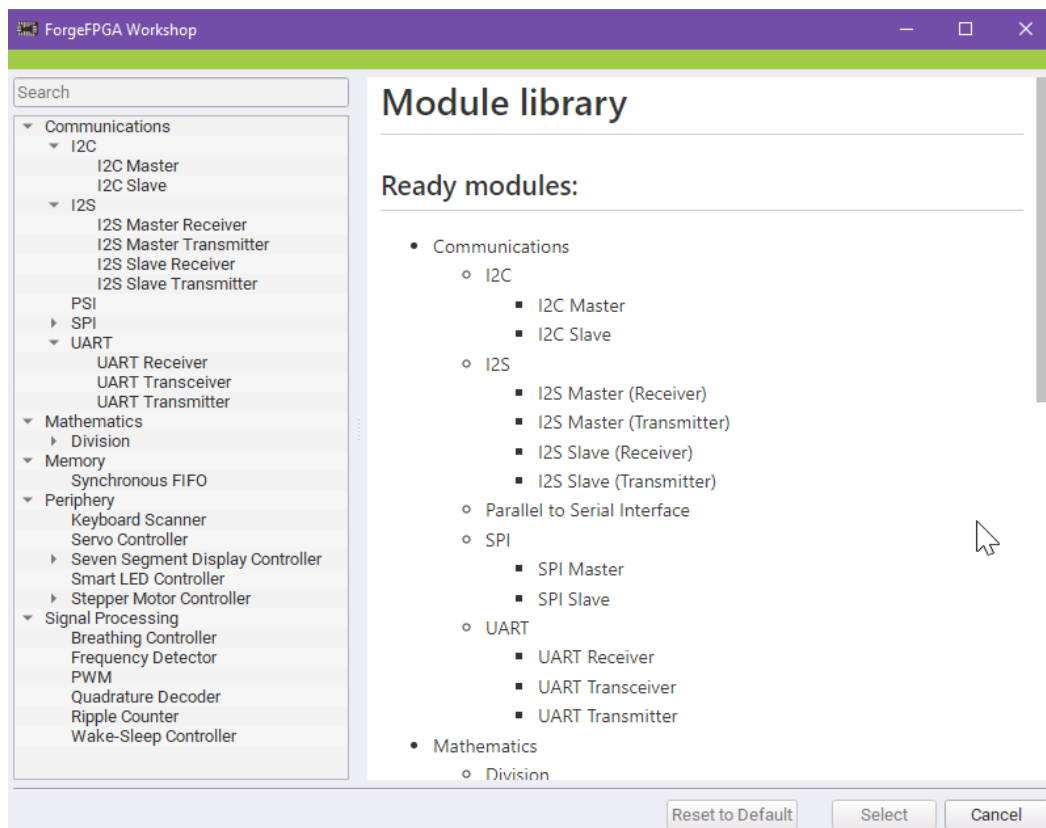

Figure 17. Modules Library GUI

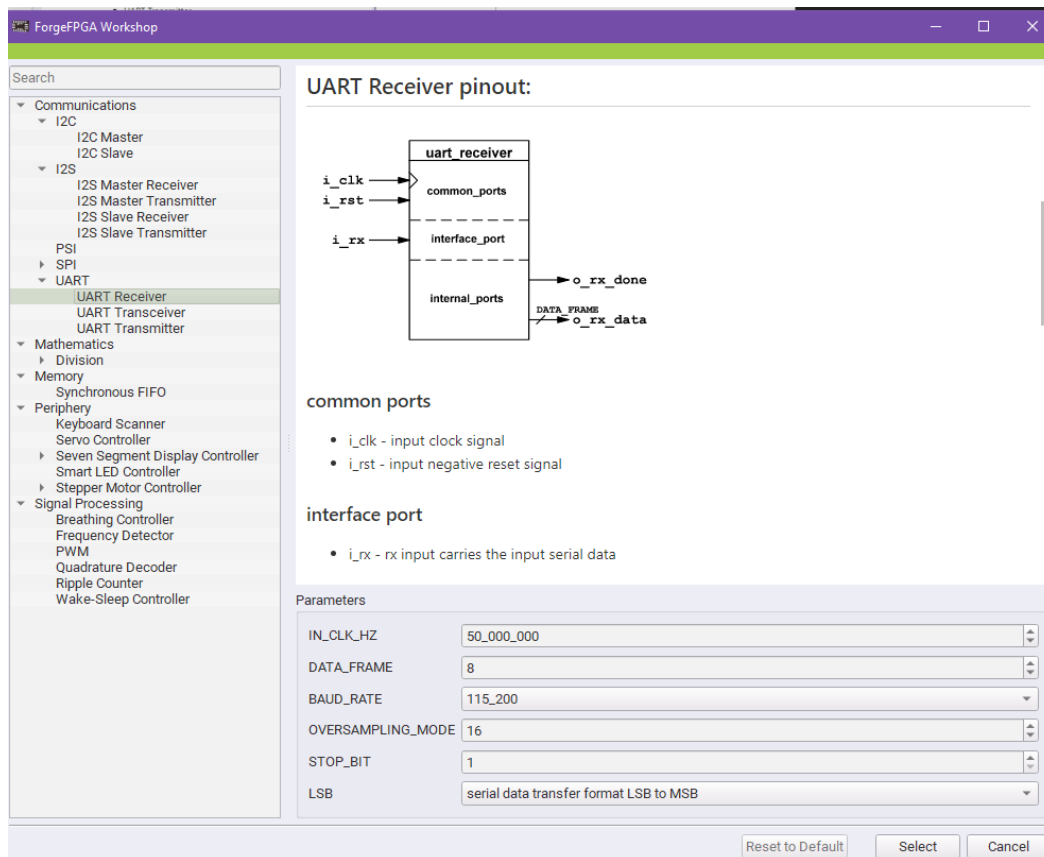

Figure 18. Module Library GUI with Parameters

The user can create multiple Module Blocks simultaneously as well. All created Module Blocks and their respective testbenches can be seen listed under the sources tab in the [Control Panel](#).

2.4 RTL Synthesis

The ForgeFPGA Editor comes with a built-in synthesis tool that takes a design as input and produces a Netlist out of it.

While performing synthesis, the input design is analyzed and converted into gate-level representation. To run synthesis on your design, you can press the **Synthesis** button on the bottom of the [Control Panel](#) or from the main menu *Tools* → *Run Synthesis*

During the process of synthesis, the software also checks for any **Syntax errors** in the written HDL code and indicates which line has the error in the [Messages Panel](#). The Synthesis process will not be completed until the code is free of any syntax errors.

User can access the Synthesis Report from the Synthesis Report button in the toolbar on top after successfully synthesising the design or from *Windows* → *Synthesis Report*.

2.4.1 I/O Planner

Each available I/O port on the FPGA has a dedicated function that can be mapped to your design using the *I/O Planner* tool to generate a special configuration file which is then used during the place-and-route procedure.

The user can access the *I/O Planner* by clicking the I/O Planner button on the toolbar or selecting it from the main menu *Windows* → *I/O Planner*.

The *I/O Planner tool* is represented as a table with the following columns:

- *Function* – the dedicated function assigned to the port.

- **Port** – editable column, where you can input ports from your HDL design, to connect them to the desired functionality. By double-clicking the desired port row, the user can choose from the list (available after Synthesis) of all the ports defined in their HDL Code.
- **Direction** – the mentioned direction is with respect to FPGA Core.
- **Description** – data describing the port type and the function it fulfills.

After the design has been synthesized, the signal from port list can be dedicated to the desired function by double-clicking on the white cell under corresponding port and selecting the signal from the list (see [Figure 19](#)).

[PIN 17] GPIO4_OUT	Output	o_counter[3]
[PIN 17] GPIO4_OE	Output	o_counter_oe[3]
[PIN 17] GPIO4_IN	Input	o_counter[3]
INT_FPGA_SLEEP	Output	o_counter_oe[0]
[PIN 18] GPIO5_OUT	Output	o_counter_oe[1]
[PIN 18] GPIO5_OE	Output	o_counter_oe[2]
[PIN 18] GPIO5_IN	Input	o_counter_oe[3]
[PIN 18] GPIO5_SLEEP	Output	o_osc_ctrl_en
[PIN 18] GPIO5_WAKEUP	Input	o_up_down_oe

Figure 19. I/O Port Signal Assignment

Note: The cell will show a warning icon when the port name is invalid. Hover over the cell to trigger the info pop-up with more details. Correct the name to perform the procedures successfully.

POSITION	FUNCTION	DIRECTION	PORT	DESCRIPTION

Figure 20. Mapping I/O Ports

To make navigation easier, the I/O Planner provides several filters with checkboxes, that can show/hide groups of ports according to their functionality (see [Figure 21](#)). User can also right click on any of the column headers to sort the signals in that column in an ascending or descending order.

Filter: ☒ Misc ☐ BRAM ☒ CLK ☒ GPIO ☒ OSC_ctrl ☐ PLL_ctrl

Figure 21. I/O Planner Filter selection

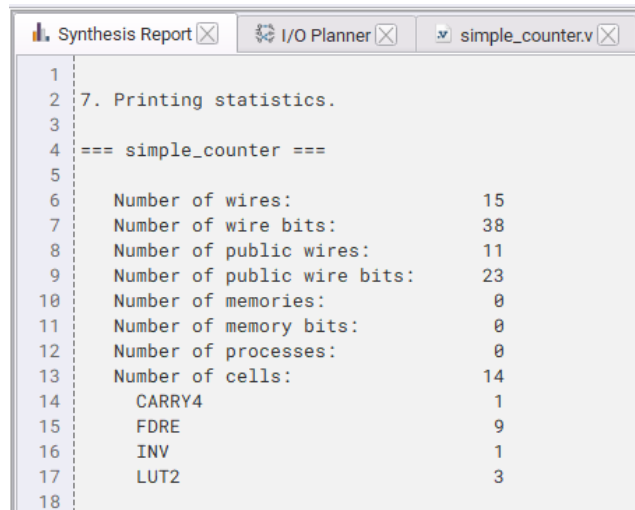

The user can also clear all the data fed inside the I/O Planner by going to main menu by selecting *Tools* → *I/O Planner* → *Clear data* as well as import/export the port data (.txt or .csv format) via main menu by selecting *Tools* → *I/O Planner* → *Import I/O Spec*.

A detailed explanation of a few important signals in the I/O Planner is provided in [I/O Planner Signals](#).

2.4.2 Synthesis Report

After performing synthesis of your current project, a new report is generated. This report shows the number of primitive objects used to represent the design in the generated [netlist](#).

To open the synthesis report window, click the corresponding button on the toolbar or via main menu, *Window* → *Synthesis Report* (see [Figure 22](#)).

Figure 22. Synthesis Report

2.4.3 Post-Synth RTL

At the Register-Transfer Level, the design is represented by combinational data paths and registers. RTL synthesis is easy as each circuit node element in the *Netlist* is replaced with an equivalent gate-level circuit. In Post-Synthesis RTL, the synthesized inputs are taken as a netlist. It helps in providing information about the clock and other clock-related logic in the design, which enables additional I/O planning.

You can find the Post-Synth RTL report by clicking the respective toolbar button or from the main menu, *Window* → *Post-Synth RTL*. The report contains all the connections made within the module between the LUTs and Carry-Chain logic.

Resources Report

Figure 23. Post-Synth RTL

2.4.4 Netlist

The system generates a netlist file after successful synthesis of the project. It describes the components and connectivity of the source design and is required to perform the subsequent place-and-route procedure. You can access the netlist by clicking the Netlist button on the toolbar or from the main menu, *Window* → *Netlist*.

You can also import an external netlist by selecting *File* → *Import* → *Netlist* from the Main Menu.

Figure 24. Netlist

2.5 Generating the Bitstream

To prepare your design to be programmed onto the device, the place-and-route procedure must be performed, that takes the elements of the synthesized netlist and maps its primitives to FPGA physical resources. This can be done once the [Netlist](#) files are successfully generated. To generate the bitstream data, click the *Generate Bitstream* button in the bottom left corner of *FPGA Editor* or, from the main menu, *Tools* → *Generate Bitstream*.

You can check Bitstream Log tab on the Message Panel to inspect the background steps after you click Generate Bitstream. In the background, the software automatically performs technology mapping, clustering and floor planning, placement and optimization, routing, and resource calculation. If an issue occurs in any of these steps, the bitstream generation will be incomplete, and you will see outcome on the [Messages Panel](#).

The generated bitstream is saved as a txt and bin file which, if generated correctly, can be used for debugging your design.

After bitstream generation is completed, you can see the generated info for the tools described later in this section.

2.5.1 Floorplan

To help with the visualization of your design, the results of the place-and-route procedure are visualized in the Floorplan window. Here you can check how the primitives from the netlist are placed and interconnected, as well as how I/O ports are mapped to the internal blocks and GPIOs.

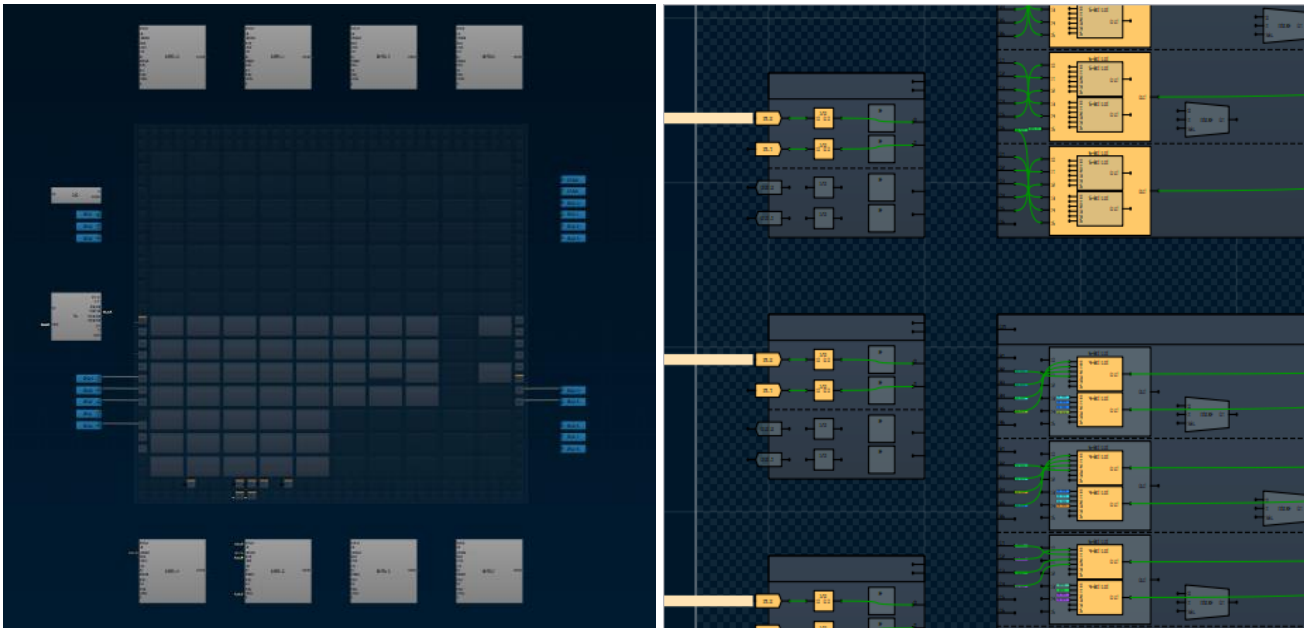

Figure 25. Floorplan Window (SLG47910)

Note: The above floorplan is for the SLG47910. Each device will have a different orientation in the floorplan as per the device design and blocks in it. However, the below mentioned functionality will remain consistent

Launch the Floorplan window by clicking the Floorplan button on the toolbar or from the main menu *Windows → Floorplan*. Use the bottom toolbar controls to take a closer look and navigate within the tool.

Click the internal components to see its details in the block configuration info panel. Also see the color scheme of the components and connections by clicking on the Legend Box icon at the bottom right (see [Figure 26](#)).

Figure 26. Place and Route Results

Users can also load external custom Place and Route settings (.log file) to display their desired connections in the floorplan. To do so, the user can select *Tools → Floorplan → Load custom PnR*.

Footer Controls (see [Figure 27](#)):

- **Zoom:** Zoom in/out the work area
- **Pan Mode:** click, hold and drag the cursor to move the work area (use the middle mouse button as an alternative)
- **Zoom to selection:** click, hold and drag a cross cursor over the element you want to zoom
- **Align Vertical/Horizontal:** align the macrocells relative to each other on the work area

- *Snap to grid*: use for precise graphic alignment of the macrocells along a grid.

Figure 27. Footer Controls

2.5.2 Resources Report

After successfully performing the bitstream generation procedure, a full report of available resource usage is generated. This report shows the amount of CLBs, FFs, Pins, LUTs are being used for the synthesized design.

A summary of these resources utilized are also mentioned in the [Control Panel](#).

The Resources Report window is launched by clicking the **Resources** button on the toolbar or selecting from the main menu *Windows → Resources Report*.

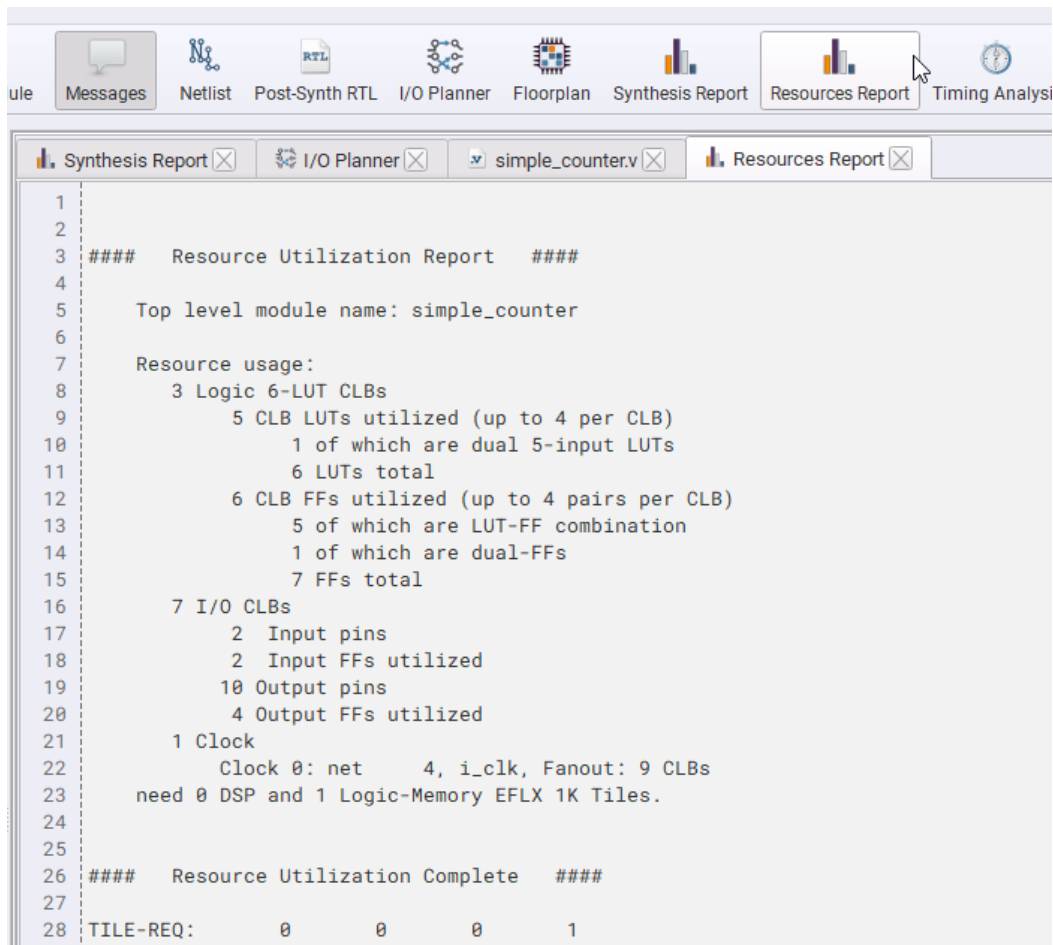

Figure 28. Resources Utilization Report

2.5.3 Timing Analysis

This tool extracts the timing and checks for any timing violations associated with any internal registers. The results show whether each of the set-up, hold, and pulse-width times are being met or not and lets you correct critical timing issues.

You can find the Timing Analysis tool on the toolbar or by selecting *Window → Timing Analysis* in the main menu.

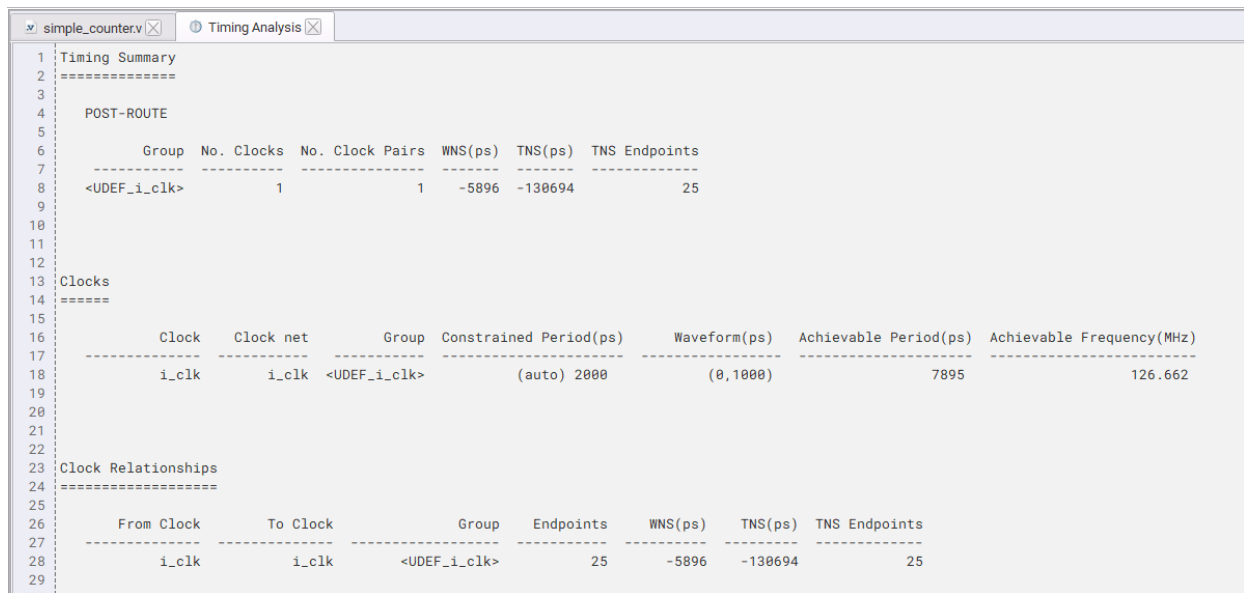

Figure 29. Timing Analysis

Add timing constraint files(.sdc file) to define clock settings and path-specific requirements ([import](#) the file via the main menu or right click mouse button on Timing Constraints in Source tree to create new). The constraints help to validate timing and optimize performance to meet design timing goals.

You can create your own .sdc file with the supported SDC commands and then if needed modify the .sdc constraints to meet your design timing goals by reanalyzing the timing results.

Supported SDC commands are as follows:

- **create_clock** — creates clock object and defines its characteristics

```
create_clock -period<arg> -name <arg> [get_ports _<arg>] -waveform <arg>
```
- **set_clock_groups** — defines relationship between groups of clocks

```
set_clock_group<arg> -group<arg>
```
- **set_false_path** — sets specific timing paths as being false and excluded from the timing analysis

```
set_false_path -from [ get_pins <arg>] - to [ get_pins <arg>]
```
- **set_multicycle_path** — determines how many clocks cycle a path can take for setup and hold checks

```
set_multicycle_path -from [get_clocks <arg>] -to [get_clocks <arg>] - from/to [get_pins <arg>] -setup <arg> - hold <arg>
```
- **set_hierarchy_separator** — defines the character used to separate different levels of hierarchy in the design

The commands below have basic support:

- **get_cells**
- **get_ports**
- **get_nets**
- **get_pins**
- **get_clocks**

In case warnings appear during SDC parsing, they can be found in build → ta directory.

The Timing Analyzer examines the timing path in the design, calculates propagation delays, checks for timing violations and reports back Negative slack (WNS) for each path. Total Negative Slack (TNS) indicates the cumulative timing violations in the design. High TNS means more violations. 0 TNS is an ideal case of no violations (see [Figure 29](#) for negative WNS and negative TNS report).

The Timing Analysis report allows you to identify the violations, modify the .sdc file. If you add, remove or modify any constraints in the .sdc file, re-run the bitstream to observe the new timing report.

2.6 Simulation

The most crucial step in successfully implementing any system is to verify the design and its functionality in response to different inputs without the need for physical hardware. A testbench is used to test the HDL source code.

The [FPGA Editor](#) works in correspondence with 3rd party software for simulating the testbench, called Icarus Verilog, and for verifying the functionality of the design by viewing simulation results we use GTKWave. Please refer to the ForgeFPGA Simulation User Guide [8] for the installation process of the additional software and quick start guide.

2.6.1 Writing a Testbench

To work with the Simulation, you should have a testbench module for the FPGA design. You can add a testbench from the Modules Library or open a module from the main menu by going to *File → New Custom Testbench* and saving the name of the testbench.

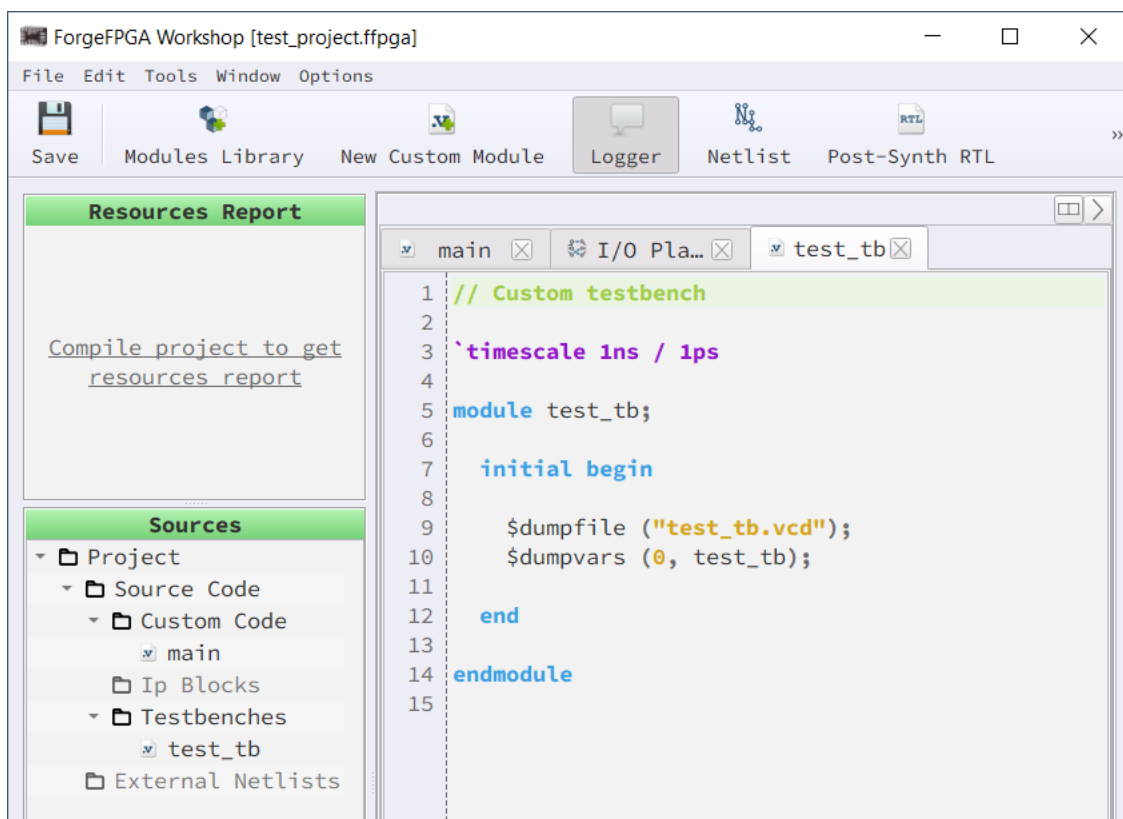

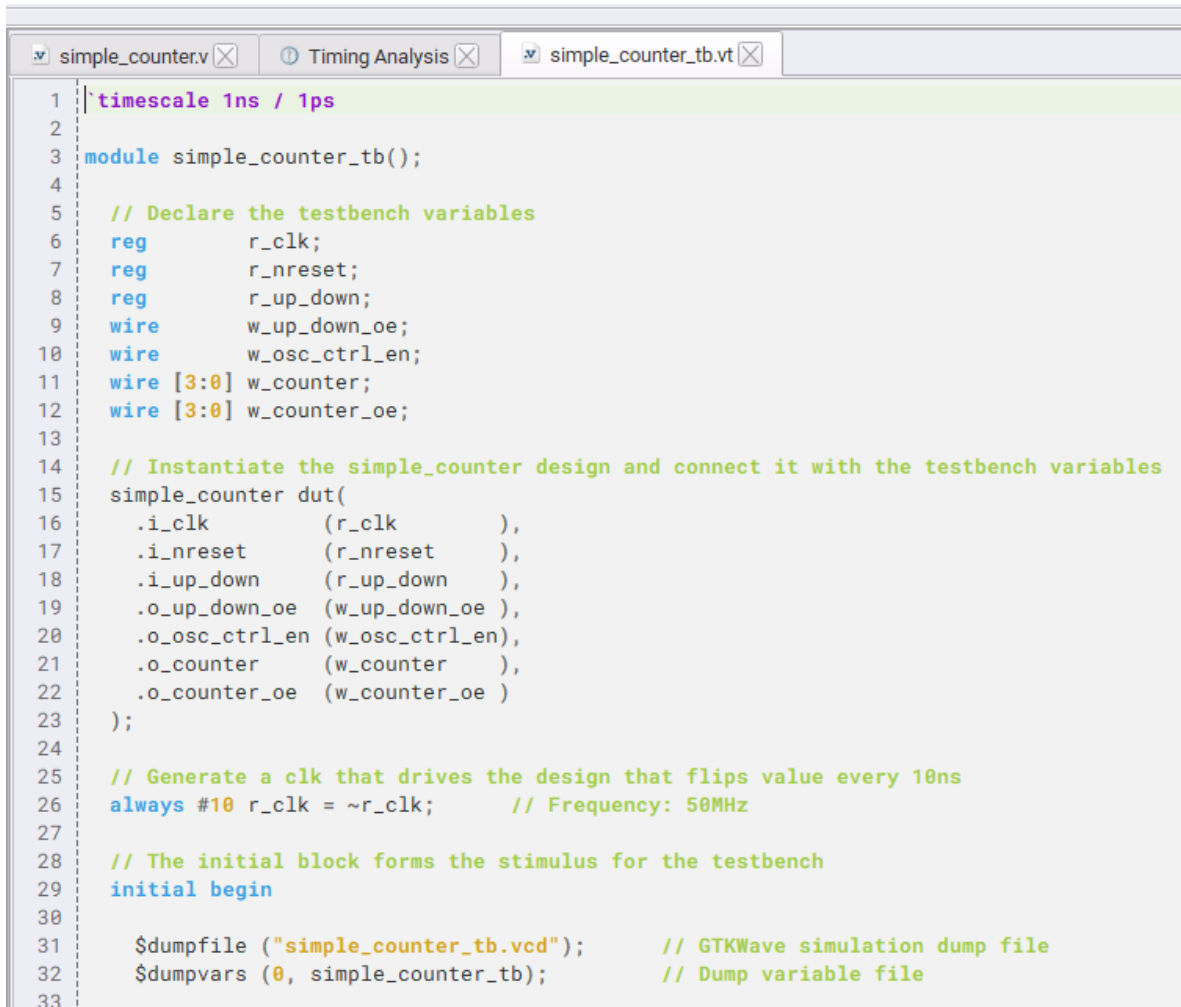

Figure 30. Custom Testbench example

To make things easy, the software opens the testbench module with a few lines of code to act as a guideline for writing the testbench. Please refer to [\[8\]](#) for details on how to write a testbench.

```

1 | `timescale 1ns / 1ps
2 |
3 | module simple_counter_tb();
4 |
5 | // Declare the testbench variables
6 | reg      r_clk;
7 | reg      r_nreset;
8 | reg      r_up_down;
9 | wire     w_up_down_oe;
10 | wire     w_osc_ctrl_en;
11 | wire [3:0] w_counter;
12 | wire [3:0] w_counter_oe;
13 |
14 | // Instantiate the simple_counter design and connect it with the testbench variables
15 | simple_counter dut(
16 |     .i_clk      (r_clk      ),
17 |     .i_nreset   (r_nreset   ),
18 |     .i_up_down  (r_up_down  ),
19 |     .o_up_down_oe (w_up_down_oe ),
20 |     .o_osc_ctrl_en (w_osc_ctrl_en),
21 |     .o_counter  (w_counter  ),
22 |     .o_counter_oe (w_counter_oe )
23 | );
24 |
25 | // Generate a clk that drives the design that flips value every 10ns
26 | always #10 r_clk = ~r_clk; // Frequency: 50MHz
27 |
28 | // The initial block forms the stimulus for the testbench
29 | initial begin
30 |
31 |     $dumpfile ("simple_counter_tb.vcd"); // GTKWave simulation dump file
32 |     $dumpvars (0, simple_counter_tb); // Dump variable file
33 |

```

Figure 31. Simple Counter Testbench example from Template Design

2.6.2 Simulating a Testbench

After the user is satisfied with the written testbench, click the Simulate Testbench button on the toolbar to launch Icarus Verilog and the GTKWave software, or from the main menu go to *Tools → Simulation → Simulate Testbench*. The simulation stage is handled by Icarus Verilog in the background, while the GTKWave shows a visual representation. If the written testbench is correct and doesn't have any syntax errors, then the GTKWave software will launch automatically, otherwise check the Messages Panel for any syntax related issues in the written testbench and make any necessary changes.

The FPGA Editor ensures you can keep working from the last saved state of simulation results. Once you make the necessary configuration changes (e.g. add signals, adjust their graphical representation, etc.), save the progress in the GTKWave tool. Next time you simulate the same testbench, you will start from where you left off the previous time.

2.7 PLL Configurator

The PLL Configurator helps to determine the parameters for the desired output signal or dividers. You can access it through the *FPGA Editor → PLL Configurator*.

PLL Calculator tab

PFD Frequency [5-VCO/16], MHz	50.000000
<input type="button" value="Apply"/>	

Figure 32). For Part Numbers with multiple PLLs, tick the checkbox to enable the component and proceed with configuration.

PLL Calculator

Summary Verilog PLL Config

PLL_1 PLL_2

Clock Options

Input Frequency, MHz	Required Output Frequency, MHz	Actual Output Frequency, MHz	PLL Output Clock
50.000000	50.000000	50.000000	<input checked="" type="checkbox"/> PLL1_fout0
	50.000000		<input type="checkbox"/> PLL1_fout1

☐ Allow Manual Adjustment

Actual Output Period Fout1, ns	
Duty Cycle, %	[44.2:51.6]
VCO Frequency [500-1000], MHz	800.000000
PFD Frequency [5-VCO/16], MHz	50.000000

Apply

Figure 32. PLL Calculator

The PLL Configurator tool has the following calculation modes:

- *Dividers auto calculation* — set the *Input Frequency* and *Required Output Frequency* parameters to achieve the desired divider values (*REFDIV*, *FBDIV*, *POSTDIV1*, and *POSTDIV2*)
- *Dividers manual adjustment* — enter *Input Frequency* along with all four dividers to receive the Actual Output Frequency value

Note: Check *Allow Manual Adjustment* to activate the mode.

Configure the parameters via the *PLL Properties* table and pass the data to registers by clicking *Apply*. The *Apply* button saves changes for each PLL separately. Manage the behavior of the confirmation window before applying the changes in [Settings](#). The *Apply* button populates the [IO Planner](#)'s PLL signals with the default names.

PLL data can also be configured via the component's Properties panel. The configurations are synchronized between the panel and [FPGA Editor](#) (see [Figure 33](#)).

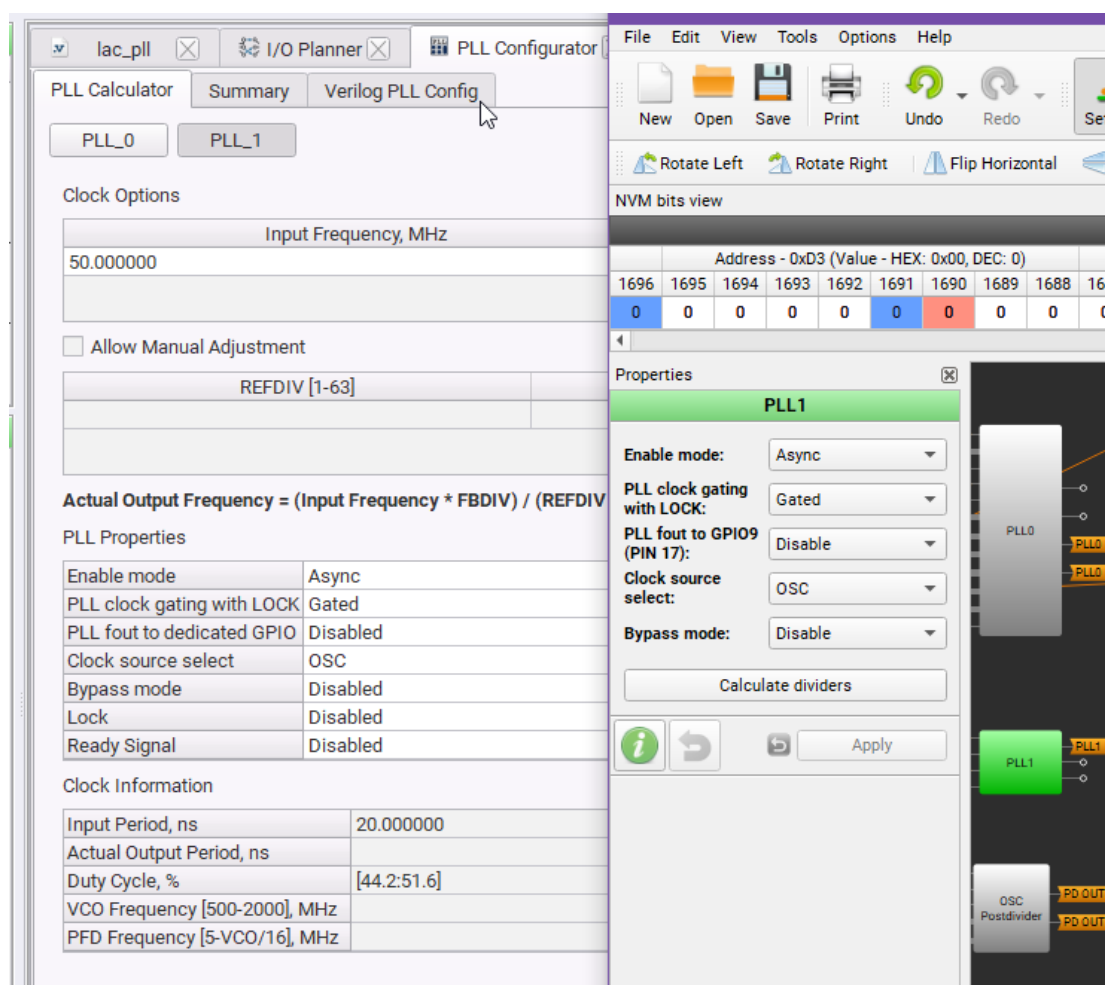

Figure 33. PLL Properties in PLL Configurator and PLL Properties

The Clock Information table values are based on the set data. The results exceeding the range are highlighted in red.

Summary tab

The current page displays the list of all configured parameters on the *PLL Calculator* tab in one place. When more than one PLL is used, the summary displayed the list of both the PLLs.

PLL Configurator		
PLL Calculator Summary Verilog PLL Config

assign pll_bypass = 1'b0;
assign pll_clk_selection = 1'b0;
```

Figure 35. Verilog PLL Config Tab

2.8 Macrocell Editor

Macrocell mode is a tool that allows the user to create the desired circuit in a schematic view. To launch Macrocell mode, the user can click the *Macrocell Editor* button on the toolbar, or the user can go to the main menu *Window* → *Macrocell Editor*.

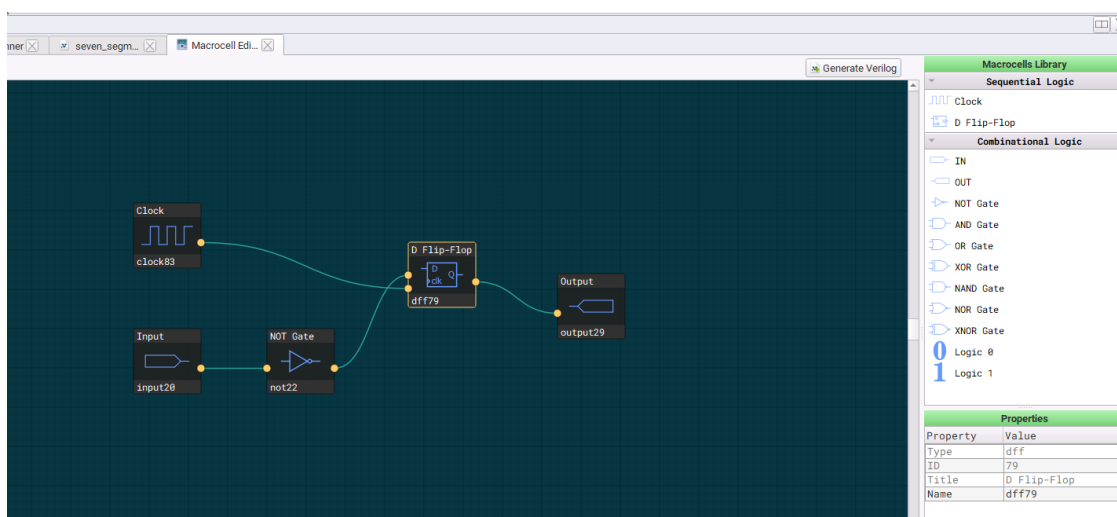

Figure 36. Macrocell Editor

The Macrocell Editor has two parts; the green screen is where the schematic of the circuit is designed by using the components on the right side of the screen which is a library of the all the *Sequential Logic & Combinational Logic* components. The user can simply drag and drop the desired component from the library on to the Green Screen to complete the circuit. Two components can be joined by clicking the two associated ports.

The Properties Panel show the details for the selected macrocell or connection. The Name field is editable (double-click the field or macrocell) (see [Figure 37](#)).

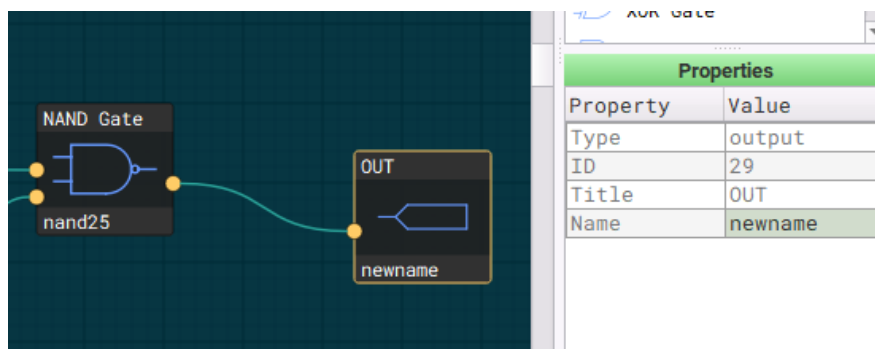

Figure 37. Changing the names of Input/Output Pins

2.9 Project Directory Folder

The software creates a folder containing the generated files as soon as any procedures are performed (synthesis, or both synthesis and bitstream generation). The folder contains the project file and a fpga folder (described later in this section) and will also store any the modules and netlists, which can be added or imported to the Sources tree in the FPGA Editor. The changes made to the sources will synchronize between the FPGA Editor and the file on disk.

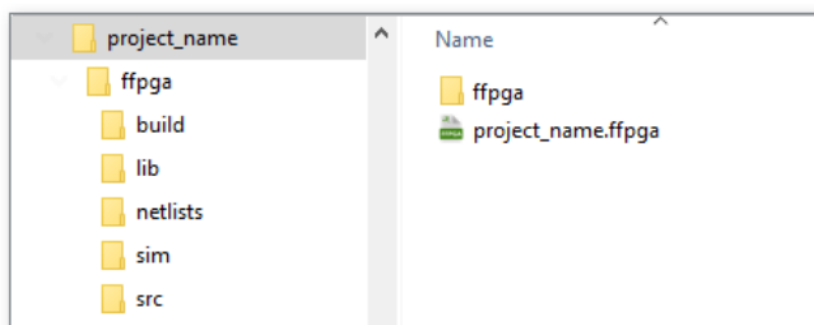

Figure 38. FPGA Project Folder Structure

The folders below store the following files:

- *lib* – modules from the [Modules Library](#)
- *sim* – testbench and simulation results files
- *src* – *main (top module)*, *mcm_generated* (created by clicking *Generate Verilog* in [Macrocell Editor](#)), and imported modules
- *netlists*- imported netlists
- *timing-constraints* – timing constraints files

You can also use the Open Containing Folder feature in the Sources Panel to quickly locate the file on disk (see [Figure 39](#)).

Figure 39. Check Source File location

The list of generated files depends on the procedures that have been performed. The descriptions of the most important files present in the build folder are the following:

- *Bitstream* – The folder containing the bitstream files in binary (.bin) and hexadecimal (.txt) format
 - *FPGA_bitstream_FLASH_MEM* – the bitstream sequence that can be used to program the flash
 - *FPGA_bitstream_MCU* – the bitstream sequence that can be used for MCU programming
- *ta-* stores log files containing potential warnings encountered during the parsing of SDC commands in the [Timing Constraints](#) file
- *FPGA_bitstream_AXI.log* – Contains the generated bitstream that represents your project's logic. This file is used while interacting with the development hardware upon performing the chip/flash procedures.
- *io_spec_in.txt* – Lists the I/O ports specification added in the I/O Planner, which is created upon clicking Generate Bitstream.
- *PNR_IO.log* – I/O ports mapping file generated after successful bitstream generation procedure.
- *netlist.edif* – The result of Yosys data processing, describing the components and connectivity within the source design. You can also import an external netlist from another software/synthesis tool.
- *PNR_PACK_PLACE.log* - Source data for building a floorplan.
- *Post_synth_results.v* – Yosys output data in the Verilog code format
- *Resource-utilization-report.log* – Information about the resources amount required for your design.
- *Simulation* – Folder containing simulation results and temporary files.

3. Debug

The design is now ready to be tested out on the development board. The generated bitstream is automatically sent to the device which is ready to be programmed further. The user now needs to switch to the main screen of the ForgeFPGA Software.

The Debug button in the toolbar starts the *Debug Tool* in the ForgeFPGA Workshop window. The Debug tool enables electronic circuit emulation and chip programming, which uses a specific hardware platform to replicate the behavior of the chip components in the design. Before starting the emulation process, test point (TP) controls need to be added to configure the emulation process. The Test Point controls allow the user to configure the GPIOs in different options.

3.1 Hardware Platforms

After the Debug button is pressed, the Development Platform Selector and the two hardware options will be displayed (see [Figure 40](#)).

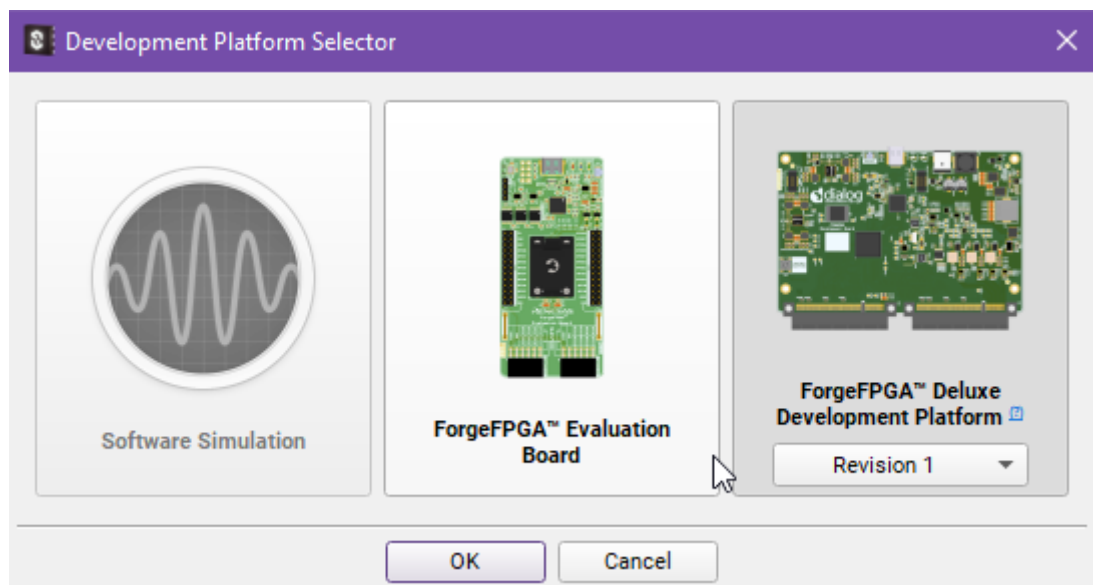

Figure 40. Development Platform Selector

3.1.1 ForgeFPGA Deluxe Development Board

The ForgeFPGA Deluxe Development Board is a multi-functional tool that makes it possible to develop, program, and emulate FPGA designs by providing an onboard power source, digital signal generation, and logic analysis capabilities. The platform can connect additional external boards called socket adapters (see [Figure 41](#)). The function of the socket adapter board is to implement an electrical connection between the pins of the chip under test and the ForgeFPGA Deluxe Development Board. To implement this, the platform uses a Dual PCIe connector.

Figure 41. Socket Board Adapter

The board can also be used as an independent unit. The chip can be powered through the EXT PWR connector and signals can be read through the through-hole 12-pin PMOD connectors.

Figure 42. Assembled equipment for working with a chip in the socket.

To start working with the FPGA device, connect the development board to the computer via a USB Type-C cable and connect the power supply. If all the connections are correct, then the red LED (PWR) and blue LED (STS) will light up. For more information on the Deluxe Development Board and the Socket Adaptor please refer to [\[5\]](#)[\[6\]](#).

3.1.2 ForgeFPGA Evaluation Board

ForgeFPGA Evaluation Board is a compact, easy-to-use, USB powered hardware tool. There are two versions of this platform (version 2.0 and 1.0).

ForgeFPGA Evaluation Board v2.0 provides the IC with hardware support for design emulation, programming, internal UART terminal options, and real-time testing. The platform mainly consists of the following blocks: programmer, socket, GPIO external connectors, and PMOD connectors. This board uses a USB Type-C connector for communications and power supply.

Figure 43. ForgeFPGA Evaluation Board v2.0

The ForgeFPGA Evaluation Board v1.0 is a simplified version of the platform and therefore, has limited functionality. Since the socket is absent, the device is soldered directly on the board. The platform provides emulation possibilities along with access to the UART terminal.

For more information on the Evaluation Board, please refer to [\[7\]](#).

Figure 44. ForgeFPGA Evaluation Board v1.0

3.2 Debugging Controls

Under the Debug tab on the main menu, the Recommended Platform Configuration guide contains information about suitable sockets, adapters, development boards, along with the device ordering information for each of the different devices. The guide is accessed by clicking on the platform's name in the Debugging controls panel (see Figure 45).

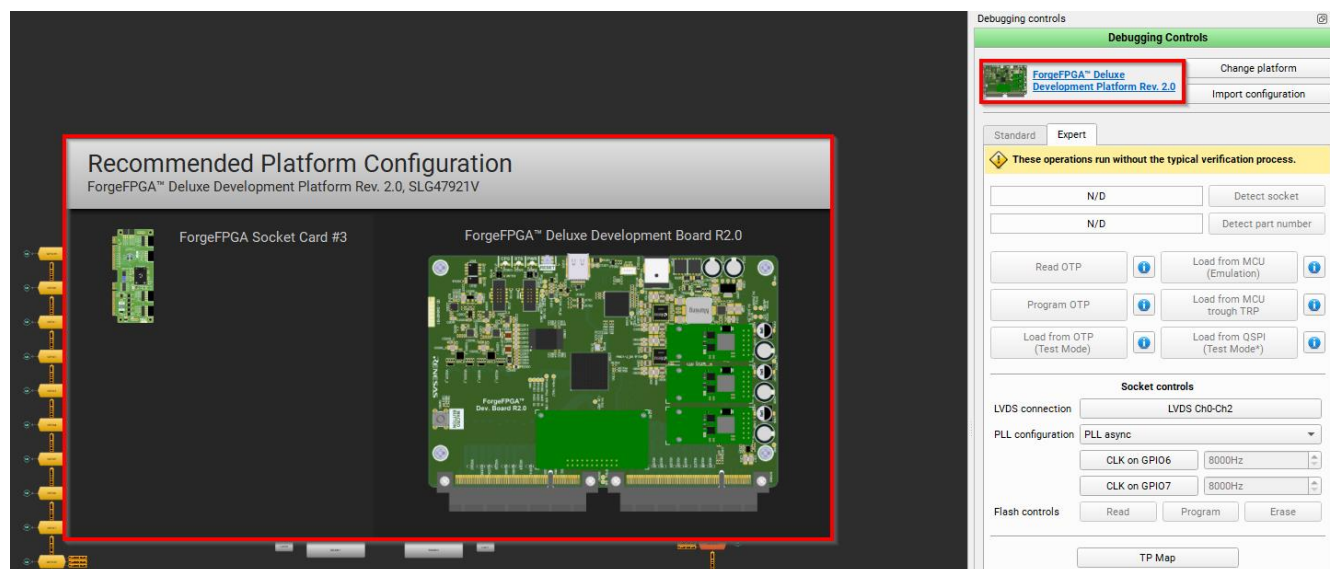

Figure 45. Platform Configuration Guide

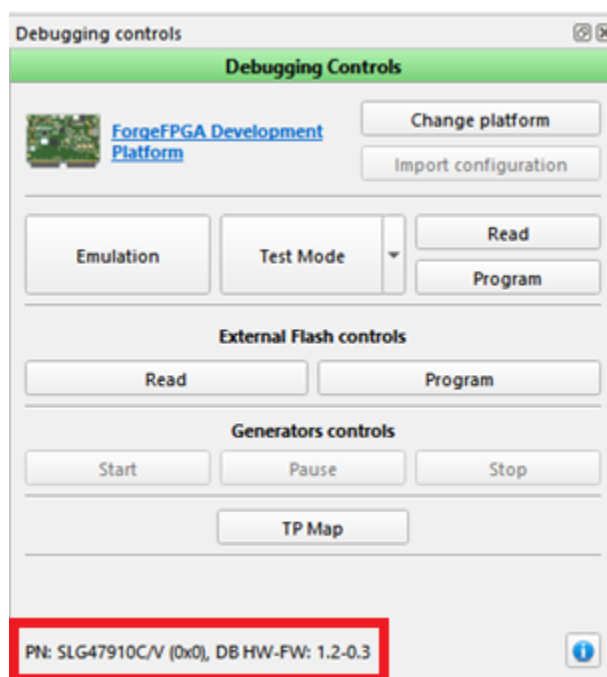

Figure 46. Debugging Controls (standard)

The Debugging Controls panel contains the UI controls for chip communication and programming, brief information about the connected device, and other features. In the software you may encounter different Debugging Control panel types (see [Figure 47](#) for below list of configurations).

Within the standard debugging controls, we provide the built-in validation checks. The list includes, but is not limited to, the following ([Figure 46](#)):

- *Socket connection test* — the software performs a validation check to confirm the chip's connection status
- *IC detection check* — it is verified whether the correct part number/revision is placed in the socket
- *Chip state analysis* — the software checks the current state of the chip to ensure correct execution of procedures, such as verifying whether the chip is empty/programmed or locked/unlocked, etc.
- *VDDs range validation* — the software ensures that the chip operates within the required VDDs voltage range

Device Configuration

- h. *Change platform* – Opens the list of development platforms that are supported
- i. *Import configuration* – Import's the configuration of test points from another platforms.

Chip Procedures

- a. *Emulation* – The current project will be loaded to the chip (but not programmed) when the control is active and will be ready for test on the hardware board.
- b. *Load from MCU* – same as Emulation
- c. *Test Mode* – Test mode is used for connecting or disconnecting the chip's I/O pads to Test Point controls, configured by the user. Also, a user can check the programmed device using the test mode without emulation (OTP Mode). To do this, turn on Test Mode and the internal V_{DD} button. Test mode can work without power on the chip. The user will control the power manually. Another feature of the Test Mode is that it can test with the conditions from Flash Memory.
- d. *Load from OTP* – same as Test Mode
- e. *Read OTP* – data from OTP can be read.
- f. *Load from MCU through TRP* – same as Emulation, but the procedure sequence goes through TRP
- g. *Read* – Read the device using the hardware board or from the external flash memory.
- h. *Program* – Program the device or the external device with the current project.

Flash Procedures

Flash memory is located on the FPGA Sockets. The controls are below:

- a. *Test Mode (*)* – Load data from flash to the device.
- b. *Load from QSPI* – Same as Test Mode*
- c. *Read* – read the chip project from the flash memory
- d. *Program* – program a flash memory with the current project
- e. *Erase* – clean flash memory (erased flash memory address values will be read as 0xFF)

Generator Controls – During emulation, you can start all the test points together or pause them or even Stop them from running altogether. Start/Pause/Stop

TP Map – show the test point map on the work area to reflect the physical test points on the development platform. The Test Points of each pin will be shown next to their respective pin.

Socket Controls

- LVDS Connection* – the setting LVDS enables LVDS switches, configuring all channels simultaneously
- PLL Configuration* - the PLL generator operates in two modes: sync and async. In sync mode, both generators start simultaneously with a 90-degree phase shift at a set frequency. In async mode, each generator can be individually enabled or disabled and operates independently. Output is available on GPIO8 and GPIO9 (located under the socket as J21 and J22)

The image shows a software interface titled "Debugging Controls" with a green header. Below the header, there is a small image of a circuit board and the text "ForgeFPGA™ Deluxe Development Platform". To the right of this are two buttons: "Change platform" and "Import configuration". Below these are two tabs: "Standard" and "Expert", with "Expert" being the active tab. A yellow warning banner with an exclamation mark icon states: "These operations run without the typical verification process." Below the banner, there are several input fields and buttons. The first row has a text field "ForgeFPGA Socket Card #3, HW 01, FW 01" and a button "Detect socket". The second row has a text field "SLG47921V" and a button "Detect part number". Below these are six buttons arranged in two columns: "Read OTP", "Load from MCU (Emulation)", "Program OTP", "Load from MCU through TRP", "Load from OTP (Test Mode)", and "Load from QSPI (Test Mode*)". Each button has a small information icon (i) to its right. Below the buttons is a section titled "Socket controls". It contains a label "LVDS connection" with a dropdown menu showing "LVDS Ch0-Ch2". Below that is a label "PLL configuration" with a dropdown menu showing "PLL async". Under "PLL configuration", there are two rows of controls: "CLK on GPIO6" with a frequency dropdown set to "8000Hz", and "CLK on GPIO7" with a frequency dropdown set to "8000Hz". Below these are three buttons: "Read", "Program", and "Erase", under the label "Flash controls". At the bottom of the panel is a large button labeled "TP Map". At the very bottom, there is a status bar that says "Board details: HW v1.2, FW v1.11.4" and a small information icon (i) on the right.

Figure 47. Debugging Control Panel (Expert)

Information details

Brief information about the last detected chip (where e.g. SLG47910 C/V is part number and package name and (0x0) is a metal revision. DB HW-FW: 1.2-0.3 explains that the Development Board is detected with rev 1.2 of the Hardware and rev 1.11.4 for Firmware

The Expert panel provides the same set of features without including the additional validation checks (Figure 47)

3.3 Debug Tools

The *Debug Tool* controls are used to configure input signals on the inputs of external devices. There are many ways in which we can manage the device input signals.

Note: Some debug functions are not available when using ForgeFPGA Evaluation Board for testing.

Use the context menu on GPIOs with a right click to see the connectivity options (Figure 48).

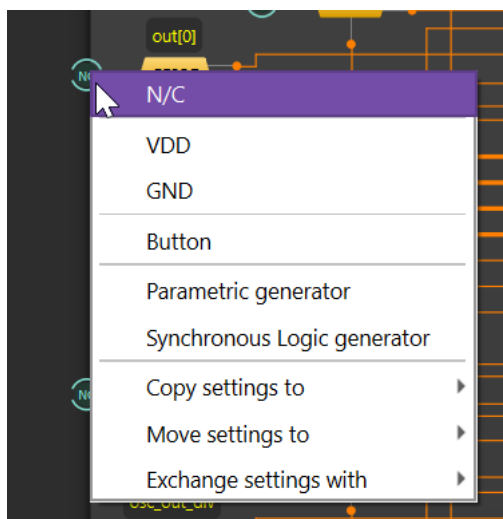

Figure 48. Debug Tool

▪ NC (not connected)

Figure 49. NC (not connected)

▪ VDD

Figure 50. Set to VDD

▪ GND

Figure 51. Set to GND

3.3.1 Configuration Button

The Configuration Button has three functions. The user can configure the button to establish the connection as VDD, GND or Hi-Z. If the user wants the GPIO to be a fixed connection to VDD, then the LATCH option should be selected. The LATCH option will make sure that the GPIO is connected to a particular signal (VDD/GND/Hi-Z). This will enable the button to be LATCHED to VDD unless it is changed (see [Figure 52](#), [Figure 53](#), and [Figure 54](#)).

The default connection option is VDD/GND, but it can be changed to Hi-Z by selecting Hi-Z option from the Upper Connection or the Lower Connection option as needed from the context menu. In [Figure 53](#), you can see that the Upper Connection "U" corresponds to Hi-Z, and the Bottom Connection "B" corresponds to GND.

If the configuration is set as UNLATCHED and the default connection is set as Upper Connection "U" which equals to Hi-Z and the Bottom Connection "B" to GND, whenever the button is pressed, there will be toggle in the waveform between Hi-Z and GND at that very moment with the default waveform being at Hi-Z (see [Figure 53](#)).

Figure 52. Latched Button with Upper Connection as VDD

Figure 53. Unlatched Button with Upper Connection as Hi-Z

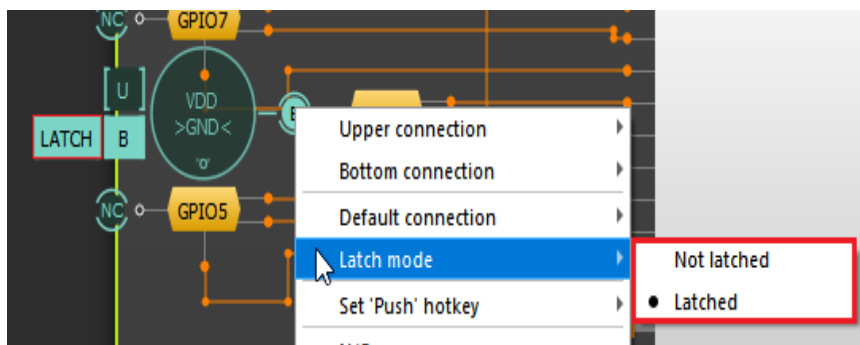

Figure 54. Context menu options for Configurable Button

3.3.2 Synchronous Logic Generator

Right click on the NC of the desired GPIO and from the context menu select the Synchronous Logic Generator option. The synchronous Logic Generator is used for generating the logic pulses and waveforms for each of the GPIOs. The 'Edit' Button allows the signal to be configured.

Figure 55. Synchronous Logic Generator

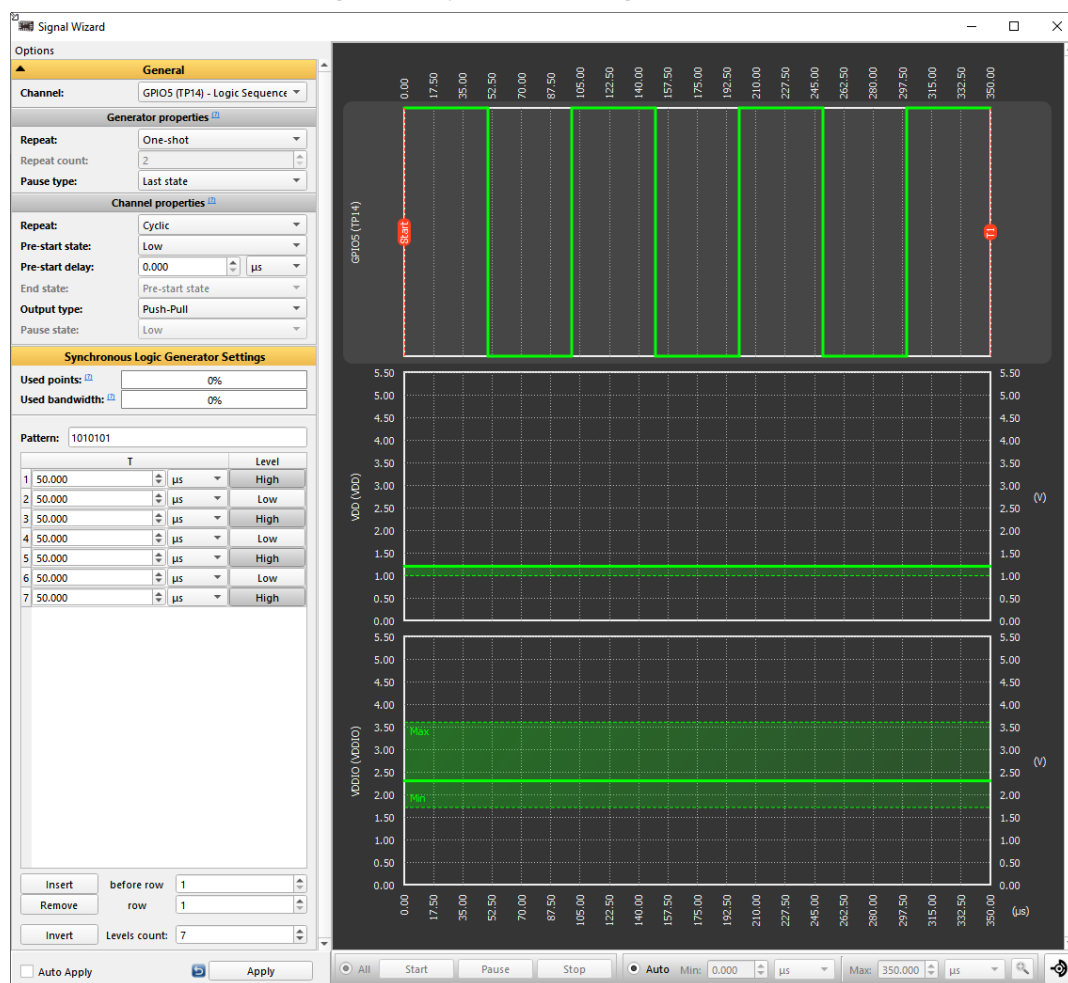

Figure 56. Signal Wizard for Synchronous Logic Generator

Below are the different features in the Signal Wizard for Synchronous Logic Generator (Figure 56).

- i. *Used Points*: Amounts of points which are already used by patterns on all channels. Point indicates a moment when generator changes a state on at least on channel.
- ii. *Used Bandwidth*: Percentage of used resources needed to successfully execute generator's pattern.
- iii. *Pattern*: 0 = low, 1 = high level. We can set the pattern of pulse levels.
- iv. *Repeat*: One Shot / Cyclic / Custom.
- v. *T / levels*: it sets the duration of each pulse.
- vi. *Insert*: To insert pulse before selected position.
- vii. *Remove*: remove pulse from the selected position.
- viii. *Invert*: to invert the pattern from (For ex. '1010' to '0101').
- ix. *Level Count*: to insert the total number of pulses to be generated.

3.3.3 Parametric Generator

The parametric Generator generates logic pulses that follow different protocol sequences. It can be selected from the context menu of all GPIOs.

In the signal Wizard, a special editor shows the sequence of commands. Actions available in the command editor:

- Add or remove commands by clicking + or –
- Change command parameters
- Change the order of commands by dragging the commands to another position

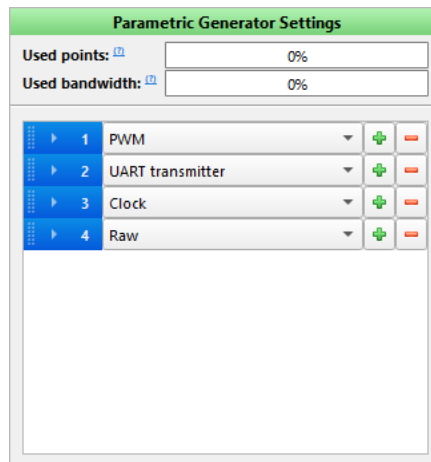

Figure 57. Parametric Generator Command Editor

The list of available commands:

- *PWM (Pulse Width Modulation)* – the PWM command editor has three input fields:
 - *Period* – a united duration of high and low states per repeat
 - *Duty cycle* – the percentage of the total duration in the high state
 - *Repeats* – pattern repeat count

Figure 58. PWM Command Editor

- *Clock* – the command generates a signal oscillating between a high and a low state. The editor has two input fields:
 - *Period* – the united duration of high and low states per repeat
 - *Repeats* – pattern repeat count

Figure 59. Clock Command Editor

- *UART Transmitter* – generates signal according to the UART standard:
 - *Baud rate* – signal's frequency
 - *Data frame* – number of bits allocated for user input

- *Data* – user input in hex format. In case the data frame is lower than the bits required to represent data, more significant bits are ignored
- *Parity bit* – create parity bit for error detection
- *Stop bit size* – duration of the stop bit
- *Bit order* – serial data transfer format

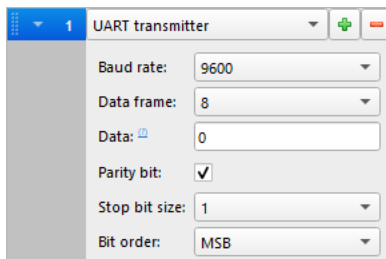

Figure 60. Clock Command Editor

- *Raw* – this parent works as a typical Logic Generator

3.4 Logic Analyzer

The ForgeFPGA Workshop has a built-in Logic Analyzer which can be used to observe the waveforms during testing via the ForgeFPGA Deluxe Development Board. The *Logic Analyzer* tool allows you to capture multiple signals from a digital circuit. It has advanced triggering capabilities and a protocol decoder that helps to see the timing relationship between multiple signals and decode them.

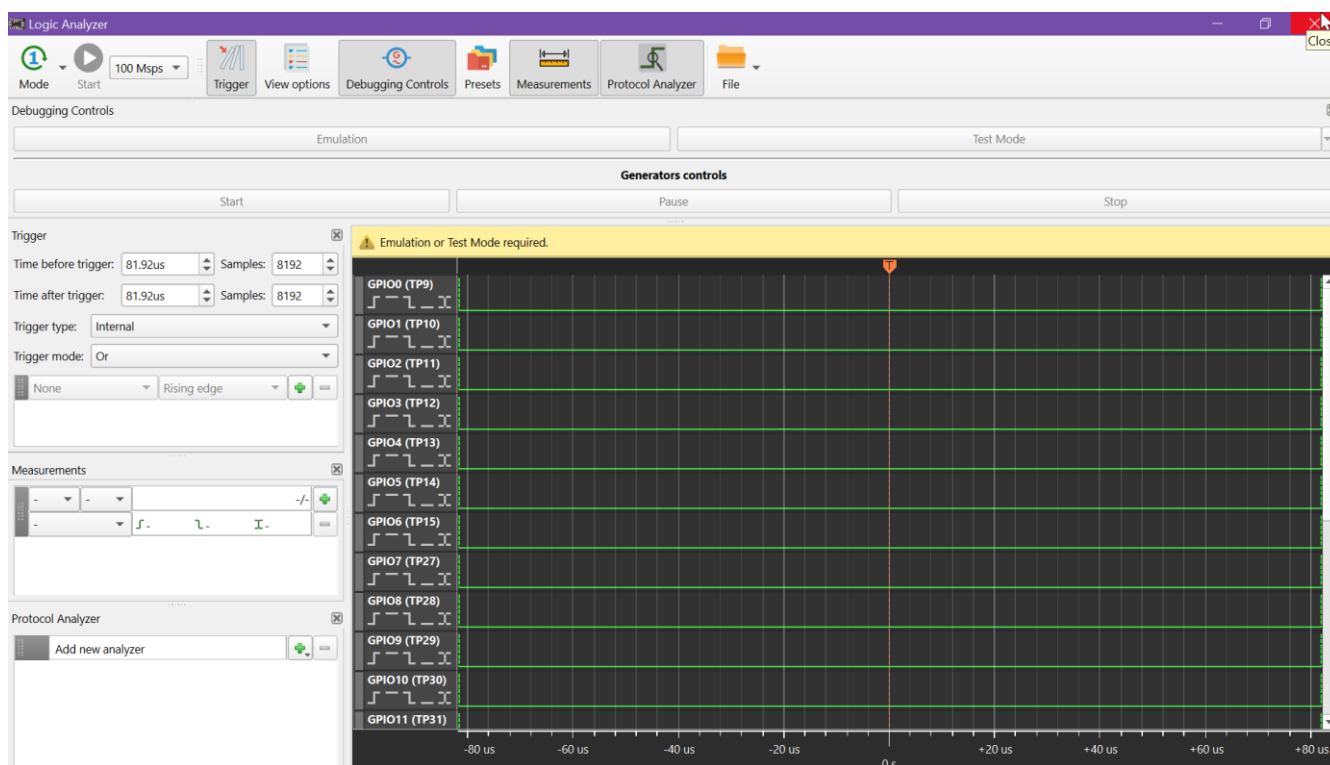

Figure 61. Logic Analyzer

The characteristics of the Logic Analyzer are the following:

- Frequency range – 500 Hz to 200 MHz
- Buffer Size – 16384 samples
- SPI, I2C, Parallel and UART protocol support

3.4.1 Operational Controls

- *Start* – Launch the Logic Analyzer. The Start button becomes active after Emulation or Test Mode is started.
- *Sampling rate* – Drop down selector for the signal sampling frequency.

3.4.2 Mode

There are three operating modes:

- *Auto mode* – Trigger events are ignored. The signal on the pins is shown as a continuous waveform.
- *Single shot* – Refreshes the waveform pattern once a trigger event is detected.
- *Normal mode* – Refreshes the waveform pattern each time when a trigger condition is met.

3.4.3 Triggers

Set time parameters to choose the trigger time position or a specific sample number.

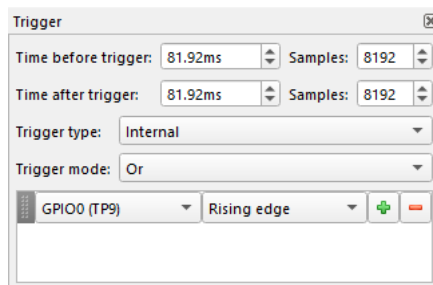

Figure 62. Trigger Parameters

The trigger type can also be configured (see [Figure 62](#)):

- *Hardware button* – the trigger is activated by pressing a physical button on the board
- *Internal* – the trigger is activated when the trigger conditions, which is set in the trigger list is met.

The internal trigger can also be configured with the following options:

- *Or* – any of the trigger conditions added to the trigger list are met
- *And* – all trigger conditions added to the trigger list are met

An internal trigger must have the following settings specified:

- *Channel* – assign the trigger to the specified channel
- *Condition* – rising edge, falling edge, both edges, and high and low state

Note: set proper trigger conditions for successful sampling (e.g. Rising edge and Falling edge together with the trigger mode may result in improper trigger work).

GPIO0 (TP9)	Low level	+	-
GPIO1 (TP10)	High level	+	-
GPIO2 (TP11)	Falling edge	+	-

Figure 63. Trigger Conditions

Figure 64. Trigger Configuration

3.4.4 Debugging Controls

The Debugging Control panel is responsible for Emulation, Test Mode, and Generator control functionality.

Figure 65. Debugging Controls

The channels in the View options panel can be shown or hidden using the buttons at the bottom.

Figure 66. View Options

3.4.5 Presets

The Logic Analyzer configurations can be stored in presets and restored from a previous configuration when needed.

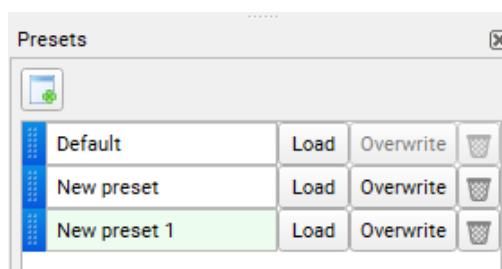

Figure 67. Logic Analyzer Configuration Presets

- **New Preset** – Create a new preset for the current Logic Analyzer configuration
- **Load** – load a selected preset configuration
- **Overwrite** – overwrite preset with the current Logic Analyzer configuration
- **Delete Preset** – remove the selected preset
- **Default** – load the default preset of the Logic Analyzer window

- *Autosave [time]* – the modified preset is saved each time the Logic Analyzer window, the Debug tool, or ForgeFPGA workshop is closed.

3.4.6 Protocol Analyzer

The *Protocol Analyzer* decodes data according to the selected protocol.

Figure 68. Protocol Analyzer Decode Options

To analyze captured data, click the + button and select one of the protocols.

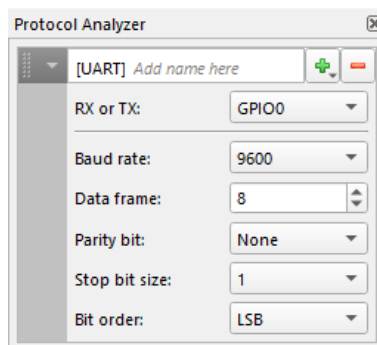

Figure 69. Protocol Analyzer Options

Figure 70. Decoded Data

Then, choose a channel for analysis and modify the protocol settings if necessary. The decoded data will be displayed above the corresponding plot.

Data can be easily exported from the Protocol Analyzer by clicking the Save button next to the Protocol Analyzer name field. If the parameters are selected correctly, a CSV file of the data will be saved.

3.4.7 Import/Export

The waveform data can be imported or exported in CSV format. These options are grouped under the File Menu on the top toolbar.

Figure 71. Import/Export from/to CSV format

3.4.8 Plot Widget

The plot widget displays the waveforms in the Logic Analyzer window. The way a plot is shown can be changed via the plot context menu. Right-click on a plot area to add a marker, show or hide the time scale, change the plot height, and select the cursor width.

Figure 72. Plot Widget

The plot area can be navigated using the following controls:

- Move left/right by left click + drag left/right
- Scroll up/down by mouse wheel up/down
- Zoom in/out by CTRL + mouse wheel up/down
- Quick zoom in/out with the middle mouse button click + drag up/down
- Reorder waveforms by Drag and Drop

3.4.9 Cursors

A cursor is a measurement tool for calculating waveform data between the edge of one or more plots. To see the cursor, hover the mouse over a measured section of a waveform.

A *Half Period* cursor measures the distance between the two nearest edges at a hovered section of a waveform.

Figure 73. Half Period Cursor

A Period cursor measures the width of the hovered half period, the duration of a full period, and calculates the frequency and what fraction of the full period the hovered area of the period is, which is the Duty Cycle.

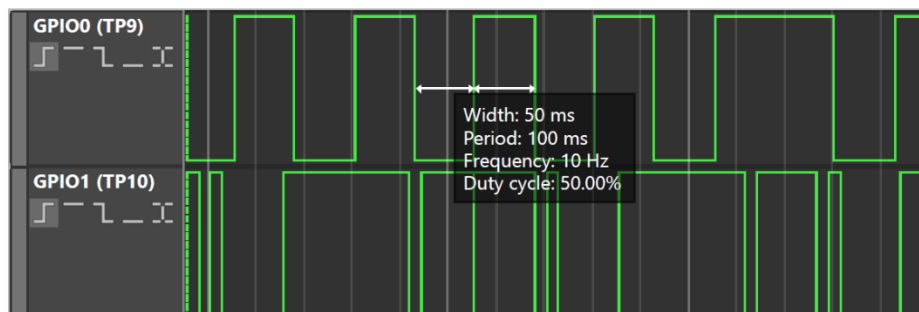

Figure 74. Period Cursor

To change the cursor width, open the context menu and select either the Period or Half Period option.

To measure data at a distance that exceeds one period, left click the edge you want to measure from and hover over the edge you want to measure to. This will give you the total duration of the measured section, the calculated average frequency, and the quantity of rising and falling edges well as their sum.

Figure 75. Adjustable Period Cursor for Measurement

You can also measure the width between the edges on the distinct waveforms.

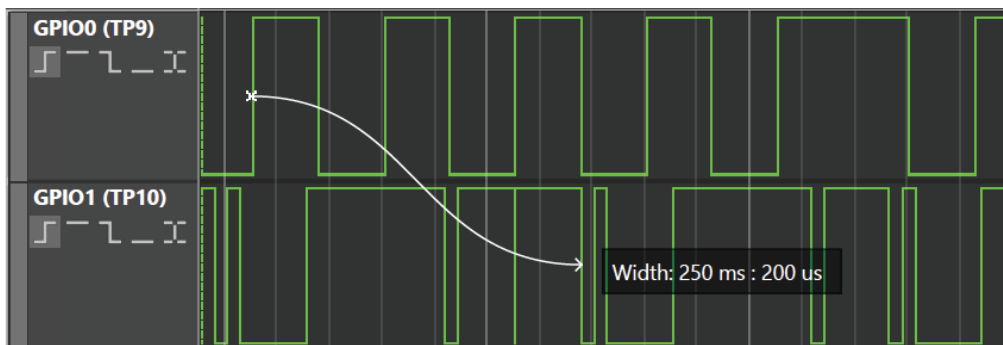

Figure 76. Adjustable Period Cursor Measurement between waveforms

3.4.10 Markers

You can do the following actions with markers:

- Add a new marker with a CTRL + left click on the markers panel
- Set a new marker from the plot's context menu
- Remove the marker with a CTRL + right-click on the marker head
- Move the marker by a left-click + drag the mouse cursor

Figure 77. Moving markers with context menu

- Move from the context menu by a left-click on the marker's head
- Select the marker by clicking on the marker head, the selected marker has a white line on top
- Move the selected marker to the closest visible left/right line by CTRL + LEFT/RIGHT arrow key
- Move the selected marker left/right by one sample with CTRL + SHIFT + LEFT/RIGHT arrow key

3.4.10.1 Marker Measurements

- *Measurements* – Period and frequency. The frequency value is rounded to four decimals.
- *Additional measurements* – counts the rising edges, falling edges, and all edges in the period between the markers

To calculate all measurements between two markers, select the markers and a channel in combination boxes.

Figure 78. Marker Measurements

3.5 UART Terminal

The UART Terminal is a console tool used for serial communication between the board and an external device. While developing a project, the UART terminal helps to *read* and *write* via the UART protocol. This UART terminal is available only on the [ForgeFPGA Evaluation Board](#).

To start working with the terminal, ensure that the Evaluation Board platform is selected. Open the UART Terminal tool on the top toolbar.

Figure 79. UART Terminal Tool

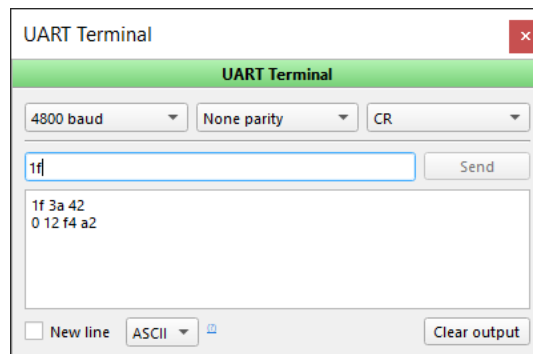

Figure 80. UART Terminal Window

The following fields are available under UART Terminal for edit -

- **Baud rate** – Selects the baud rate from the list for read and write operations.
- **Parity control** – Selects whether and how the parity control bit is used.
- **Line ending** – Selects which character is used as a new line character. No line ending, new line (NL), Carriage Return (CR), or both New Line & Carriage Return. This option is available in ASCII mode only.
- **New line** – Add a new line after each byte sent if set; otherwise, send the entire message at once.
- **Data format** – Selects the data format: ASCII or Hex. For Hex, the input case is independent, and numbers are separated by a space.

The input field supports copy/paste operations. The output field only supports copying of the received data.

3.6 DAC Tool

The DAC Tool allows you to configure the voltage level on special analog output socket pins.

Figure 81. Analog I/O Pins on ForgeFPGA Socket Adapter

Start by selecting the appropriate development platform and opening the DAC Tool from the toolbar (see [Figure 82](#)).

Figure 82. DAC Tool on the toolbar

All the analog I/O pins are displayed by default. Use an “Analog I/O n” button to enable a respective output pin and use a spin box at the right to set a desired voltage level on it (see [Figure 83](#)).

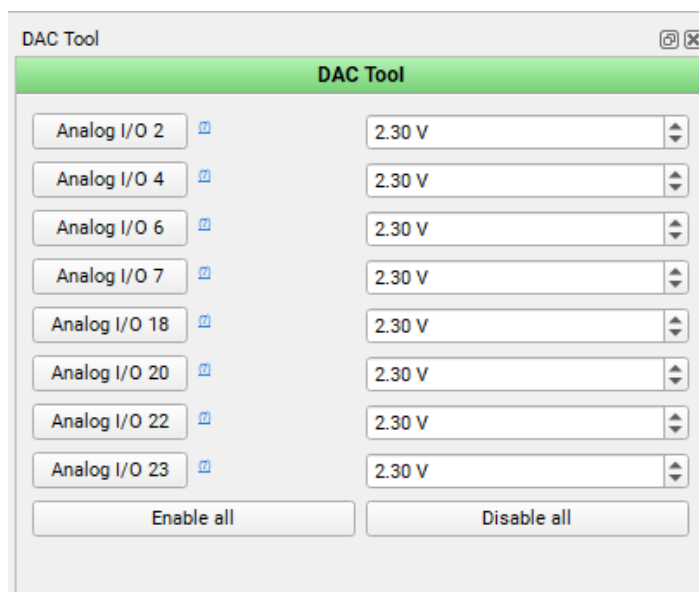

Figure 83. DAC Tool Settings

Note: Setting a voltage level on analog I/O pins is enabled only if Emulation or Test Mode is activated.

3.7 HBRAM OTP Data Editor

HBRAM OTP Data Editor allows you to modify the bit values of BRAM and User OTP macrocell registers. Open the tool from the toolbar, or BRAM/User OTP macrocell Properties panel.

Figure 84. HBRAM OTP Data Editor on the toolbar

The tool provides separate tables for configuring BRAM and User OTP macrocell bits. Choose whether to represent the data in decimal or hexadecimal format.

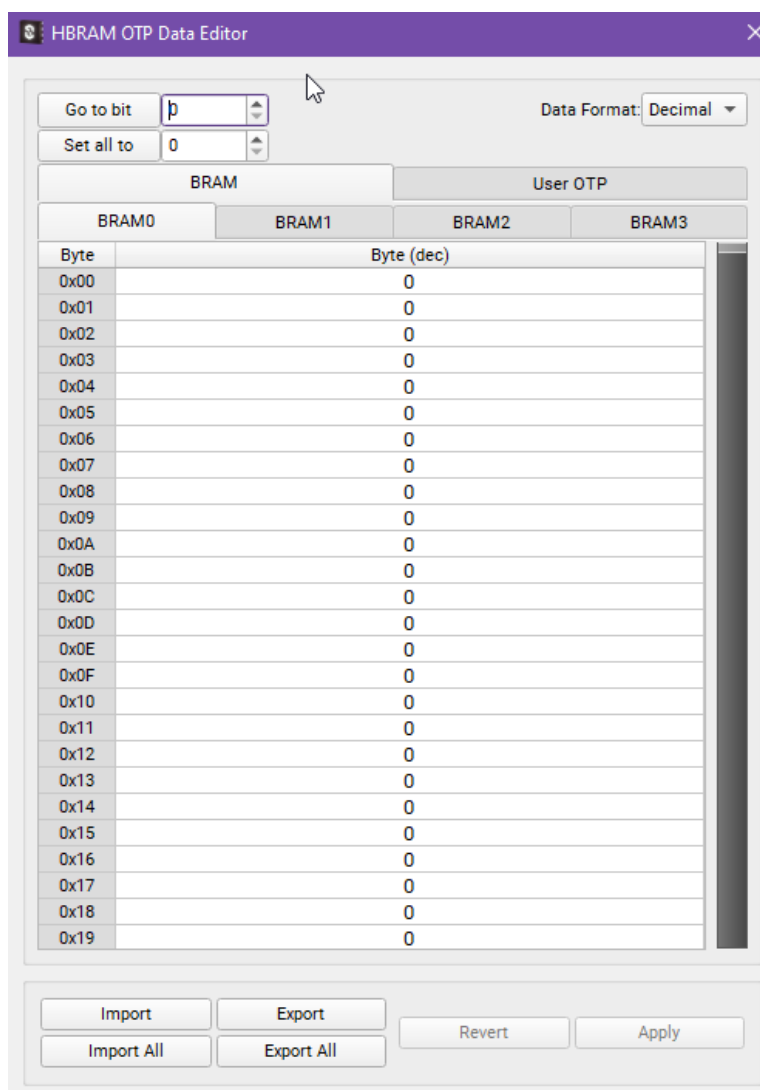

Figure 85. HBRAM OTP Data Editor (BRAM tab)

Use the upper controls to navigate through the table with the *Go to bit* button. You can also set a specified value for all bits in the active tab using *Set all to*.

The bottom controls provide an option to import or export the data either from the active tab using the Import/Export buttons or from all tabs with Import all/Export all buttons (the latter options are applicable for BRAM only).

4. NVM Viewer

In the ForgeFPGA Workshop the user can view all bits that correspond to each function in the NVM Viewer. 1s and 0s in the NVM Viewer indicate whether a particular function is enabled or disabled.

The NVM Viewer can be viewed by clicking the appropriate button on the toolbar. The NVM Viewer is divided into byte size addresses. In total the number of bits range from 0 to 479.

When a block property is changed, the corresponding bit of that parameter changes and it is represented by a change of color.

NVM viewer cells can exist in the following states:

0	Bit range of a selected block
0	Bits with 0 value
1	Bits with 1 value
0	Latest bit changed to 0 value
1	Latest bit change to 1 value

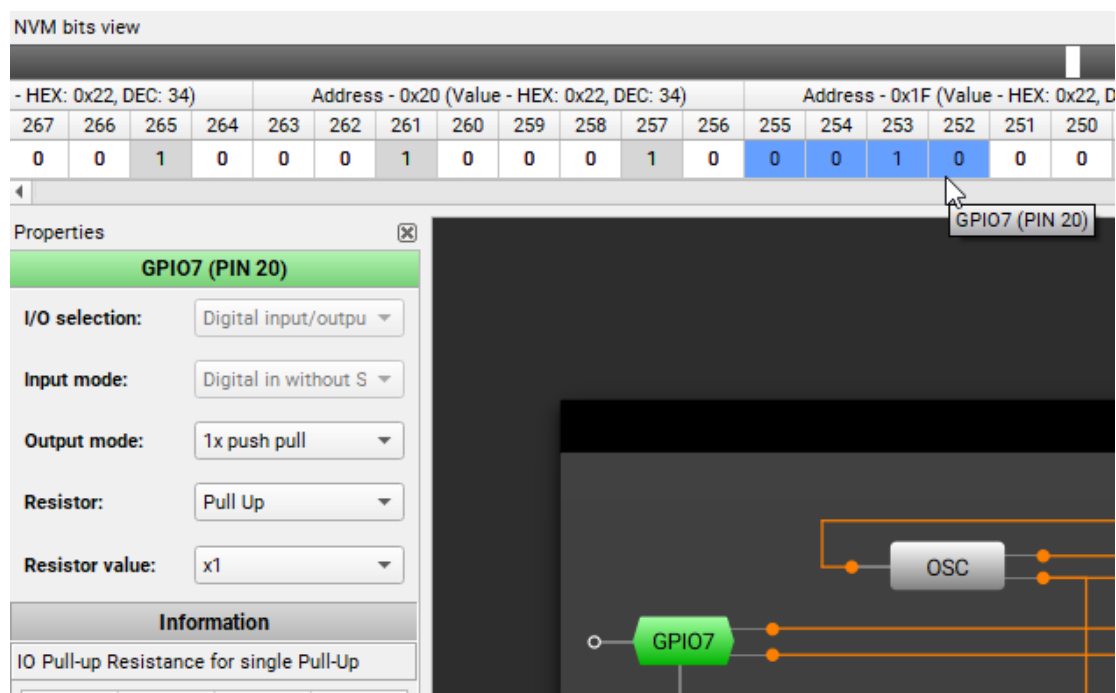

Figure 86. NVM Bits for GPIO7

If the resistor value is changed from x1 to x2, this results in the change of bits for GPIO7 from 0010 to 0011 (see Figure 87).

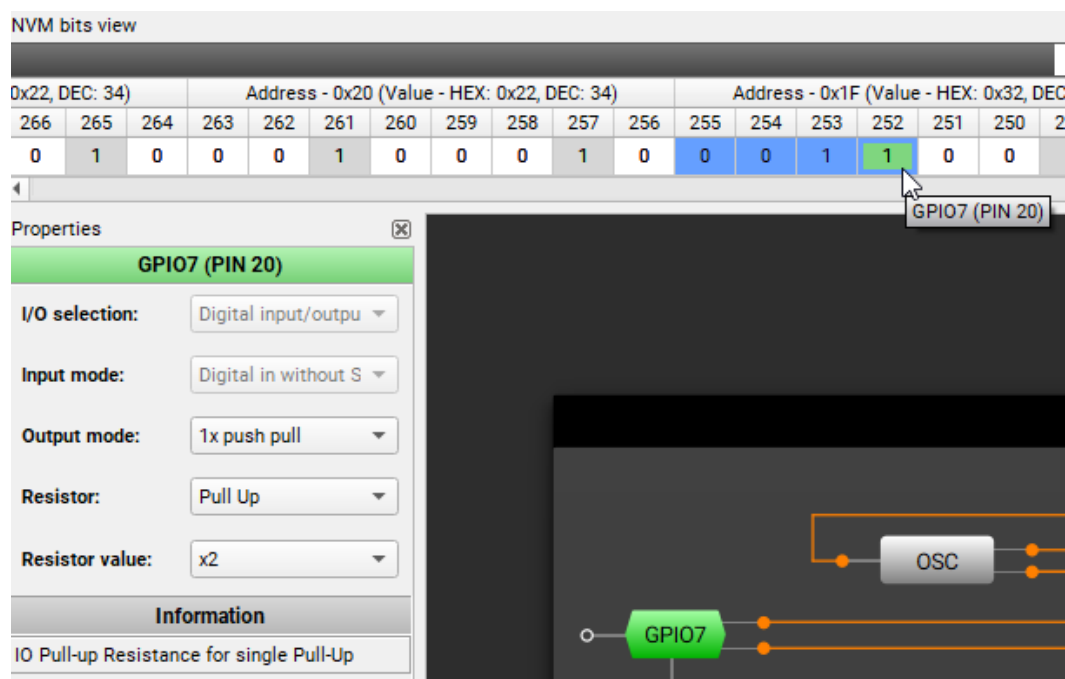

Figure 87. NVM Bits 0011 after the property has been modified

The NVM viewer navigation bar can also identify the location of either selected or changed bits in the table (the color on the bar corresponds the color of the cell described above). In addition, a gray color represents 0 values while white represents 1 value (see [Figure 87](#)).

Value - HEX: 0x08, DEC: 8					Address - 0xE0 (Value - HEX: 0x10, DEC: 16)								Address - 0xDF (Value - HEX: 0x0F, DEC: 15)							
804	1803	1802	1801	1800	1799	1798	1797	1796	1795	1794	1793	1792	1791	1790	1789	1788	1787	1786	1785	
0	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0	

Figure 88. NVM viewer top bar

The user can hover over any bit in the NVM to check which functionality is represented by those bits. A detailed representation of each bit in NVM can be found in the SLG47910's Datasheet Appendix.

5. I/O Planner Signals

The table below explains the functions of a few of the signals that are mentioned in the [I/O Planner](#) section of the software.

Signal Name	Direction	Function
OSC_READY	Input (to the FPGA Core)	Indicates that Oscillator output frequency is stable; gates OSC_CLK while OSC_READY=0
FPGA_CORE_READY	Input	Signal indicates when FPGA Core has been configured. Goes HIGH before entering Functional Mode; doesn't go LOW in Retention (Sleep) Mode; goes LOW during transition into Reset Mode. Can be used as reset or enable signal for user logic
FUNC_MODE	Input	Signal that indicates that the device is in Functional Mode. When it goes high - user clocks are ungated available for FPGA Core; when it goes LOW - clocks gating is initiated. Signals go LOW when exiting from Functional Mode and transits to Retention (Sleep) or Reset Mode. This signal can be used as reset or enable signal if logic requires to be reset when not in Functional Mode or to be enabled only when in Functional mode
INT_FPGA_SLEEP	Output (from the FPGA Core)	Internal Sleep start signal - initiates transition to Retention (Sleep) mode from IOB (requires Reg nSLEEP signal source to be set)
INT_FPGA_RESET	Output	Internal Reset start signal - initiates transition to Reset mode from IOB (requires nRESET signal source to be set)
REF_LOGIC_AS_CLK0	Output	Logic as Clock 0 Reference signal - output signal that is looped through LaC circuit and returned to core as clock
REF_LOGIC_AS_CLK1	Output	Logic as Clock 1 Reference signal - output signal that is looped through LaC circuit and returned to core as clock
LOGIC_AS_CLK0_EN	Output	Logic as Clock 0 Enable (active HIGH)
LOGIC_AS_CLK1_EN	Output	Logic as Clock 1 Enable (active HIGH)
LOGIC_AS_CLK0	Input	Logic as Clock 0, clock output
LOGIC_AS_CLK1	Input	Logic as Clock 1, clock output
REF_BRAM (0..3)_READ_CLK	Output	BRAM Slices 0..3 Read Clock
REF_BRAM (0..3)_WRITE_CLK	Output	BRAM Slices 0..3 Write Clock
REF_BRAM (4..7)_READ_CLK	Output	BRAM Slices 4..7 Read Clock
REF_BRAM (4..7)_WRITE_CLK	Output	BRAM Slices 4..7 Write Clock
GPIOX_OUT	Output	GPIOX Output value
GPIOX_OE	Output	GPIOX Output Enable (active HIGH)
GPIOX_IN	Input	GPIOX Input value

More information about the signals in the I/O Planner can be accessed by enabling the description column under [Settings](#) → I/O Planner → Show Description column.

6. Revision History

Revision	Date	Description
1.00	May 20, 2024	Initial release.
2.00	Oct 22, 2024	Added new sections on <ul style="list-style-type: none">• Import/Export RTL Files• Design Template• Synthesis Report• Updated PLL Calculator• Updated Project Directory Folder• Changed Advanced Dev Board name to Deluxe Dev Board• DAC Tool• Updated Block Properties
2.01	May 03, 2025	Updated information in sections <ul style="list-style-type: none">• Settings• I/O Planner• Timing Analysis• Project Directory Folder• NVM Viewer• PLL Configurator• Rearranged index• Debugging Control Added new section – HBRAM OTP Data Editor Removed Block Properties Section

A. Appendix: Warnings

Below is a list of warnings & its respective meaning that the Yosys displays in the Logger section of the software after [Synthesis](#) and [Generate Bitstream](#) Process

1. The network is combinational (run "fraig" or "fraig_sweep").

 >> This is an error generated when handling a purely combinational input. It is produced by the optimization tool and can be simply ignored.
2. Bit <N> of cell port <port> driven by <D> will be left unconnected in EDIF output.

 >> Port is driven by an undefined value. Connect the port to a proper driver.
3. Exporting x-bit on <N> as zero bit.

 >> A port is in an undefined state. Make sure it is driven by a proper signal.
4. Cell <M> is an unmapped internal cell of type <T>.

 >> After synthesis you are left with unmapped cells, make sure you use valid synthesizable Verilog.
5. Drivers conflicting with a constant <N> driver: <K>

 >> A port was driven by both a constant value and a signal. Please correct your code.
6. Multiple conflicting drivers for <N>: <K>

 >> Several wires were defined to drive a port. Please correct your code.
7. Wire <N> is used but has no driver.

 >> No driver was assigned to a wire.
8. Wire <N> has 'init' attribute and is not driven by an FF cell.

 >> A wire is set to be initialized to a certain value but is not driven by an FF.
9. I/O pin name not found! <N>

 >> A port name was specified in the I/O Planner, but the match for it wasn't found in the synthesized netlist. Please make sure the names of the ports in the I/O Planner correspond to your design.
10. Input IOB port specification differs from the resulting one. Please check if all IOB ports were mapped properly.

 >> Input and output I/O Planner specifications differ. Check if you've mapped the ports of your design correctly.
